Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Storm Drain Signage SD-13

Design Objectives

- Maximize Infiltration
- Provide Retention
- Slow Runoff
- Minimize Impervious Land Coverage
- ✓ Prohibit Dumping of Improper Materials
- Contain Pollutants
- Collect and Convey

Description

Waste materials dumped into storm drain inlets can have severe impacts on receiving and ground waters. Posting notices regarding discharge prohibitions at storm drain inlets can prevent waste dumping. Storm drain signs and stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets.

Approach

The stencil or affixed sign contains a brief statement that prohibits dumping of improper materials into the urban runoff conveyance system. Storm drain messages have become a popular method of alerting the public about the effects of and the prohibitions against waste disposal.

Suitable Applications

Stencils and signs alert the public to the destination of pollutants discharged to the storm drain. Signs are appropriate in residential, commercial, and industrial areas, as well as any other area where contributions or dumping to storm drains is likely.

Design Considerations

Storm drain message markers or placards are recommended at all storm drain inlets within the boundary of a development project. The marker should be placed in clear sight facing toward anyone approaching the inlet from either side. All storm drain inlet locations should be identified on the development site map.

Designing New Installations

The following methods should be considered for inclusion in the project design and show on project plans:

- Provide stenciling or labeling of all storm drain inlets and catch basins, constructed or modified, within the project area with prohibitive language. Examples include "NO DUMPING –

CASQA California Stormwater Quality Association

DRAINS TO OCEAN" and/or other graphical icons to discourage illegal dumping.

- Post signs with prohibitive language and/or graphical icons, which prohibit illegal dumping at public access points along channels and creeks within the project area.

Note - Some local agencies have approved specific signage and/or storm drain message placards for use. Consult local agency stormwater staff to determine specific requirements for placard types and methods of application.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. If the project meets the definition of "redevelopment", then the requirements stated under " designing new installations" above should be included in all project design plans.

Additional Information

Maintenance Considerations

- Legibility of markers and signs should be maintained. If required by the agency with jurisdiction over the project, the owner/operator or homeowner's association should enter into a maintenance agreement with the agency or record a deed restriction upon the property title to maintain the legibility of placards or signs.

Placement

- Signage on top of curbs tends to weather and fade.

- Signage on face of curbs tends to be worn by contact with vehicle tires and sweeper brooms.

Supplemental Information

Examples

- Most MS4 programs have storm drain signage programs. Some MS4 programs will provide stencils, or arrange for volunteers to stencil storm drains as part of their outreach program.

Other Resources

A Manual for the Standard Urban Stormwater Mitigation Plan (SUSMP), Los Angeles County Department of Public Works, May 2002.

Model Standard Urban Storm Water Mitigation Plan (SUSMP) for San Diego County, Port of San Diego, and Cities in San Diego County, February 14, 2002.

Model Water Quality Management Plan (WQMP) for County of Orange, Orange County Flood Control District, and the Incorporated Cities of Orange County, Draft February 2003.

Ventura Countywide Technical Guidance Manual for Stormwater Quality Control Measures, July 2002.

Maintenance Bays & Docks SD-31

Design Objectives

- Maximize Infiltration
- Provide Retention
- Slow Runoff
- Minimize Impervious Land Coverage
- ✓ Prohibit Dumping of Improper Materials
- ✓ Contain Pollutants
- Collect and Convey

Description

Several measures can be taken to prevent operations at maintenance bays and loading docks from contributing a variety of toxic compounds, oil and grease, heavy metals, nutrients, suspended solids, and other pollutants to the stormwater conveyance system.

Approach

In designs for maintenance bays and loading docks, containment is encouraged. Preventative measures include overflow containment structures and dead-end sumps. However, in the case of loading docks from grocery stores and warehouse/distribution centers, engineered infiltration systems may be considered.

Suitable Applications

Appropriate applications include commercial and industrial areas planned for development or redevelopment.

Design Considerations

Design requirements for vehicle maintenance and repair are governed by Building and Fire Codes, and by current local agency ordinances, and zoning requirements. The design criteria described in this fact sheet are meant to enhance and be consistent with these code requirements.

Designing New Installations

Designs of maintenance bays should consider the following:

- Repair/maintenance bays and vehicle parts with fluids should be indoors; or designed to preclude urban run-on and runoff.
- Repair/maintenance floor areas should be paved with Portland cement concrete (or equivalent smooth impervious surface).

CASQA California Stormwater Quality Association

- Repair/maintenance bays should be designed to capture all wash water leaks and spills. Provide impermeable berms, drop inlets, trench catch basins, or overflow containment structures around repair bays to prevent spilled materials and wash-down waters form entering the storm drain system. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.

- Other features may be comparable and equally effective.

The following designs of loading/unloading dock areas should be considered:

- Loading dock areas should be covered, or drainage should be designed to preclude urban run-on and runoff.

- Direct connections into storm drains from depressed loading docks (truck wells) are prohibited.

- Below-grade loading docks from grocery stores and warehouse/distribution centers of fresh food items should drain through water quality inlets, or to an engineered infiltration system, or an equally effective alternative. Pre-treatment may also be required.

- Other features may be comparable and equally effective.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Additional Information

Stormwater and non-stormwater will accumulate in containment areas and sumps with impervious surfaces. Contaminated accumulated water must be disposed of in accordance with applicable laws and cannot be discharged directly to the storm drain or sanitary sewer system without the appropriate permit.

Other Resources

A Manual for the Standard Urban Stormwater Mitigation Plan (SUSMP), Los Angeles County Department of Public Works, May 2002.

Model Standard Urban Storm Water Mitigation Plan (SUSMP) for San Diego County, Port of San Diego, and Cities in San Diego County, February 14, 2002.

Ventura Countywide Technical Guidance Manual for Stormwater Quality Control Measures, July 2002.

Safer Alternative Products SC-35

Description

Promote the use of less harmful products and products that contain little or no TMDL pollutants. Alternatives exist for most product classes including chemical fertilizers, pesticides, cleaning solutions, janitorial chemicals, automotive and paint products, and consumables (batteries, fluorescent lamps).

Approach

Pattern a new program after the many established programs around the state and country. Integrate this best management practice as much as possible with existing programs at your facility.

Develop a comprehensive program based on:

- The "Precautionary Principle," which is an alternative to the "Risk Assessment" model that says it's acceptable to use a potentially harmful product until physical evidence of its harmful effects are established and deemed too costly from an environmental or public health perspective. For instance, a risk assessment approach might say it's acceptable to use a pesticide until there is direct proof of an environmental impact. The Precautionary Principle approach is used to evaluate whether a given product is safe, whether it is really necessary, and whether alternative products would perform just as well.
- Environmentally Preferable Purchasing Program to minimize the purchase of products containing hazardous ingredients used in the facility's custodial services, fleet maintenance, and facility maintenance in favor of using alternate products that pose less risk to employees and to the environment.
- Integrated Pest Management (IPM) or Less-Toxic Pesticide Program, which uses a pest management approach that minimizes the use of toxic chemicals and gets rid of pests by methods that pose a lower risk to employees, the public, and the environment.
- Energy Efficiency Program including no-cost and low-cost energy conservation and efficiency actions that can reduce both energy consumption and electricity bills, along with long-term energy efficiency investments.

Consider the following mechanisms for developing and implementing a comprehensive program:

- Policies

Objectives

- Educate
- Reduce/Minimize
- Product Substitution

Targeted Constituents

Sediment	
Nutrients	✓
Trash	
Metals	✓
Bacteria	
Oil and Grease	✓
Organics	✓

CASQA California Stormwater Quality Association

- Procedures
  - Standard operating procedures (SOPs)
  - Purchasing guidelines and procedures
  - Bid packages (services and supplies)
- Materials
  - Preferred or approved product and supplier lists
  - Product and supplier evaluation criteria
  - Training sessions and manuals
  - Fact sheets for employees

Implement this BMP in conjunction with the Vehicle and Equipment Management fact sheets (SC20 – SC22) and SC41, Building and Grounds Maintenance.

Training

- Employees who handle potentially harmful materials in the use of safer alternatives.
- Purchasing departments should be encouraged to procure less hazardous materials and products that contain little or no harmful substances or TMDL pollutants.

Regulations

This BMP has no regulatory requirements. Existing regulations already encourage facilities to reduce the use of hazardous materials through incentives such as reduced:

- Specialized equipment storage and handling requirements,
- Storm water runoff sampling requirements,
- Training and licensing requirements, and
- Record keeping and reporting requirements.

Equipment

- There are no major equipment requirements to this BMP.

Limitations

- Alternative products may not be available, suitable, or effective in every case.

Requirements

Cost Considerations

- The primary cost is for staff time to: 1) develop new policies and procedures and 2) educate purchasing departments and employees who handle potentially harmful materials about the availability, procurement, and use of safer alternatives.

- Some alternative products may be slightly more expensive than conventional products.

Supplemental Information

Employees and contractors / service providers can both be educated about safer alternatives by using information developed by a number of organizations including the references and resources listed below.

The following discussion provides some general information on safer alternatives. More specific information on particular hazardous materials and the available alternatives may be found in the references and resources listed below.

- Automotive products – Less toxic alternatives are not available for many automotive products, especially engine fluids. But there are alternatives to grease lubricants, car polishes, degreasers, and windshield washer solution. Rerefined motor oil is also available.
- Vehicle/Trailer lnbrication – Fifth wheel bearings on trucks require routine lubrication. Adhesive lubricants are available to replace typical chassis grease.
- Cleaners – Vegetables-based or citrus-based soaps are available to replace petroleum-based soaps/detergents.
- Paint products – Water-based paints, wood preservatives, stains, and finishes are available.
- Pesticides – Specific alternative products or methods exist to control most insects, fungi, and weeds.
- Chemical Fertilizers – Compost and soil amendments are natural alternatives.
- Consumables – Manufacturers have either reduced or are in the process of reducing the amount of heavy metals in consumables such as batteries and fluorescent lamps. All fluorescent lamps contain mercury, however low-mercury containing lamps are now available from most hardware and lighting stores. Fluorescent lamps are also more energy efficient than the average incandescent lamp.
- Janitorial chemicals – Even biodegradable soap can harm fish and wildlife before it biodegrades. Biodegradable does not mean non-toxic. Safer products and procedures are available for floor stripping and cleaning, as well as carpet, glass, metal, and restroom cleaning and disinfecting.

Examples

There are a number of business and trade associations, and communities with effective programs. Some of the more prominent are listed below in the references and resources section.

References and Resources

Note: Many of these references provide alternative products for materials that typically are used inside and disposed to the sanitary sewer as well as alternatives to products that usually end up in the storm drain.

Building Repair and Construction SC-42

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize
- Recycle

Targeted Constituents

Sediment	✓
Nutrients	
Trash	✓
Metals	✓
Bacteria	
Oil and Grease	✓
Organics	✓

Description

Modifications are common particularly at large industrial sites. The activity may vary from minor and normal building repair to major remodeling, or the construction of new facilities. These activities can generate pollutants including solvents, paints, paint and varnish removers, finishing residues, spent thinners, soap cleaners, kerosene, asphalt and concrete materials, adhesive residues, and old asbestos installation. Protocols in this fact sheet are intended to prevent or reduce the discharge of pollutants to stormwater from building repair, remodeling, and construction by using soil erosion controls, enclosing or covering building material storage areas, using good housekeeping practices, using safer alternative products, and training employees.

Approach

Pollution Prevention

- Recycle residual paints, solvents, lumber, and other materials to the maximum extent practical.
- Buy recycled products to the maximum extent practical.
- Inform on-site contractors of company policy on these matters and include appropriate provisions in their contract to ensure certain proper housekeeping and disposal practices are implemented.

CASQA California Stormwater Quality Association

- Make sure that nearby storm drains are well marked to minimize the chance of inadvertent disposal of residual paints and other liquids.

Suggested Protocols

Repair & Remodeling

- Follow BMPs identified in Construction BMP Handbook.
- Maintain good housekeeping practices while work is underway.
- Keep the work site clean and orderly. Remove debris in a timely fashion. Sweep the area.
- Cover materials of particular concern that must be left outside, particularly during the rainy season.
- Do not dump waste liquids down the storm drain.
- Dispose of wash water, sweepings, and sediments properly.
- Store materials properly that are normally used in repair and remodeling such as paints and solvents.
- Sweep out the gutter or wash the gutter and trap the particles at the outlet of the downspout if when repairing roofs, small particles have accumulated in the gutter. A sock or geofabric placed over the outlet may effectively trap the materials. If the downspout is tight lined, place a temporary plug at the first convenient point in the storm drain and pump out the water with a vactor truck, and clean the catch basin sump where you placed the plug.
- Properly store and dispose waste materials generated from construction activities. See Construction BMP Handbook.
- Clean the storm drain system in the immediate vicinity of the construction activity after it is completed.

Painting

- Enclose painting operations consistent with local air quality regulations and OSHA.
- Local air pollution regulations may, in many areas of the state, specify painting procedures which if properly carried out are usually sufficient to protect water quality.
- Develop paint handling procedures for proper use, storage, and disposal of paints.
- Transport paint and materials to and from job sites in containers with secure lids and tied down to the transport vehicle.
- Test and inspect spray equipment prior to starting to paint. Tighten all hoses and connections and do not overfill paint containers.
- Mix paint indoors before using so that any spill will not be exposed to rain. Do so even during dry weather because cleanup of a spill will never be 100% effective.
- Transfer and load paint and hot thermoplastic away from storm drain inlets.

- Do not transfer or load paint near storm drain inlets.
- Plug nearby storm drain inlets prior to starting painting and remove plugs when job is complete when there is significant risk of a spill reaching storm drains.
- Cover nearby storm drain inlets prior to starting work if sand blasting is used to remove paint.
- Use a ground cloth to collect the chips if painting requires scraping or sand blasting of the existing surface. Dispose the residue properly.
- Cover or enclose painting operations properly to avoid drift.
- Clean the application equipment in a sink that is connected to the sanitary sewer if using water based paints.
- Capture all cleanup-water and dispose of properly.
- Dispose of paints containing lead or tributyl tin and considered a hazardous waste properly.
- Store leftover paints if they are to be kept for the next job properly, or dispose properly.
- Recycle paint when possible. Dispose of paint at an appropriate household hazardous waste facility.

Training

Proper education of off-site contractors is often overlooked. The conscientious efforts of well trained employees can be lost by unknowing off-site contractors, so make sure they are well informed about what they are expected to do.

Spill Response and Prevention

- Keep your Spill Prevention Control and Countermeasure (SPCC) Plan up-to-date.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Clean up spills immediately.
- Excavate and remove the contaminated (stained) soil if a spill occurs on dirt.

Limitations

- This BMP is for minor construction only. The State's General Construction Activity Stormwater Permit has more requirements for larger projects. The companion "Construction Best Management Practice Handbook" contains specific guidance and best management practices for larger-scale projects.
- Hazardous waste that cannot be reused or recycled must be disposed of by a licensed hazardous waste hauler.
- Be certain that actions to help stormwater quality are consistent with Cal- and Fed-OSHA and air quality regulations.

SC-42 Building Repair and Construction

Requirements

Costs

These BMPs are generally low to modest in cost.

Maintenance

N/A

Supplemental Information

Further Detail of the BMP

Soil/Erosion Control

If the work involves exposing large areas of soil, employ the appropriate soil erosion and control techniques. See the Construction Best Management Practice Handbook. If old buildings are being torn down and not replaced in the near future, stabilize the site using measures described in SC-40 Contaminated or Erodible Areas.

If a building is to be placed over an open area with a storm drainage system, make sure the storm inlets within the building are covered or removed, or the storm line is connected to the sanitary sewer. If because of the remodeling a new drainage system is to be installed or the existing system is to be modified, consider installing catch basins as they serve as effective "in-line" treatment devices. See Treatment Control Fact Sheet TC-20 Wet Pond/Basin in Section 5 of the New Development and Redevelopment Handbook regarding design criteria. Include in the catch basin a "turn-down" elbow or similar device to trap floatables.

IC3. BUILDING MAINTENANCE

Best Management Practices (BMPs)

A BMP is a technique, measure or structural control that is used for a given set of conditions to improve the quality of the stormwater runoff in a cost effective manner[1]. The minimum required BMPs for this activity are outlined in the box to the right. Implementation of pollution prevention/good housekeeping measures may reduce or eliminate the need to implement other more costly or complicated procedures. Proper employee training is key to the success of BMP implementation.

MINIMUM BEST MANAGEMENT PRACTICES

Pollution Prevention/Good Housekeeping

- Properly collect and dispose of water when pressure washing buildings, rooftops, and other large objects.
- Properly prepare work area before conducting building maintenance.
- Properly clean and dispose of equipment and wastes used and generated during building maintenance.
- Store toxic material under cover when not in use and during precipitation events.

Stencil storm drains

Training

- Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.
- Provide on-going employee training in pollution prevention.

The BMPs outlined in this fact sheet target the following pollutants:

Targeted Constituents	
Sediment	x
Nutrients	x
Floatable Materials	
Metals	x
Bacteria	x
Oil & Grease	
Organics & Toxicants	
Pesticides	
Oxygen Demanding	

Provided below are specific procedures associated with each of the minimum BMPs along with procedures for additional BMPs that should be considered if this activity takes place at a facility located near a sensitive waterbody. In order to meet the requirements for medium and high priority facilities, the owners/operators must select, install and maintain appropriate BMPs on site. Since the selection of the appropriate BMPs is a site-specific process, the types and numbers of additional BMPs will vary for each facility.

1. Properly collect and dispose of water when pressure washing buildings, rooftops, and other large objects.
    - If pressure washing where the surrounding area is paved, use a water collection device that enables collection of wash water and associated solids. Use a sump pump, wet vacuum or similarly effective device to collect the runoff and loose materials. Dispose of the collected runoff and solids properly. Refer to fact sheet *IC24 Wastewater Disposal* for guidance on appropriate methods for disposal of wash water to the sanitary sewer.
    - If pressure washing on a landscaped area (with or without soap), runoff must be dispersed as sheet flow as much as possible, rather than as a concentrated stream. The wash runoff must remain on the landscaping and not drain to pavement.
2. Properly prepare work area before conducting building maintenance.
    - Use ground or drop cloths underneath outdoor painting, scraping, and sandblasting work, and properly dispose of collected material daily.
    - Use a ground cloth or oversized tub for activities such as paint mixing and tool cleaning.

[1] EPA " *Preliminary Data Summary of Urban Stormwater Best Management Practices"*

3. Properly clean and dispose of equipment and wastes used and generated during building maintenance.
    - Clean paint brushes and tools covered with water-based paints in sinks connected to sanitary sewers or in portable containers that can be dumped into a sanitary sewer drain. Brushes and tools covered with non-water-based paints, finishes, or other materials must be cleaned in a manner that enables collection of used solvents (e.g., paint thinner, turpentine, etc.) for recycling or proper disposal.
    - Properly dispose of wash water, sweepings, and sediments.
    - Properly store equipment, chemicals, and wastes.
    - Do not dump any toxic substance or liquid waste on the pavement, the ground, or toward a storm drain.

    OPTIONAL:
    - Recycle residual paints, solvents, lumber, and other materials to the maximum extent practicable
4. Employ soil erosion and stabilization techniques when exposing large areas of soil.
    - Confine excavated materials to pervious surfaces away from storm drain inlets, sidewalks, pavement, and ditches. Material must be covered if rain is expected.
    - Use chemical stabilization or geosynthetics to stabilize bare ground surfaces.
5. Store toxic material under cover when not in use and during precipitation events.
6. Properly dispose of fluids from air conditioning, cooling tower, and condensate drains.
7. Regularly inspect air emission control equipment under AQMD permit.
8. Switch to non-toxic chemicals for maintenance when possible.
    - If cleaning agents are used, select biodegradable products whenever feasible
    - Consider using a waterless and non-toxic chemical cleaning method for graffiti removal (e.g. gels or spray compounds).
9. Use chemicals that can be recycled.
    - Buy recycled products to the maximum extent practicable

Training

1. Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.
2. Train employees on proper spill containment and cleanup.
    - Establish training that provides employees with the proper tools and knowledge to immediately begin cleaning up a spill.
    - Ensure that employees are familiar with the site's spill control plan and/or proper spill cleanup procedures.
    - Fact sheet IC17 discusses Spill Prevention and Control in detail.
3. Establish a regular training schedule, train all new employees, and conduct annual refresher training.
4. Use a training log or similar method to document training.

Stencil storm drains

Storm drain system signs act as highly visible source controls that are typically stenciled directly adjacent to storm drain inlets. Stencils should read "No Dumping Drains to Ocean".

IC7. LANDSCAPE MAINTENANCE

Best Management Practices (BMPs)

A BMP is a technique, measure or structural control that is used for a given set of conditions to improve the quality of the stormwater runoff in a cost effective manner[1]. The minimum required BMPs for this activity are outlined in the box to the right. Implementation of pollution prevention/good housekeeping measures may reduce or eliminate the need to implement other more costly or complicated procedures. Proper employee training is key to the success of BMP implementation.

MINIMUM BEST MANAGEMENT PRACTICES

Pollution Prevention/Good Housekeeping

- Properly store and dispose of gardening wastes.
- Use mulch or other erosion control measures on exposed soils.
- Properly manage irrigation and runoff.
- Properly store and dispose of chemicals.
- Properly manage pesticide and herbicide use.
- Properly manage fertilizer use.

Stencil storm drains

Training

- Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.
- Provide on-going employee training in pollution prevention.

The BMPs outlined in this fact sheet target the following pollutants:

Targeted Constituents	
Sediment	x
Nutrients	x
Floatable Materials	x
Metals	
Bacteria	x
Oil & Grease	
Organics & Toxicants	
Pesticides	x
Oxygen Demanding	x

Provided below are specific procedures associated with each of the minimum BMPs along with procedures for additional BMPs that should be considered if this activity takes place at a facility located near a sensitive waterbody. In order to meet the requirements for medium and high priority facilities, the owners/operators must select, install and maintain appropriate BMPs on site. Since the selection of the appropriate BMPs is a site-specific process, the types and numbers of additional BMPs will vary for each facility.

1. Take steps to reduce landscape maintenance requirements.
    - Where feasible, retain and/or plant native vegetation with features that are determined to be beneficial. Native vegetation usually requires less maintenance than planting new vegetation.
    - When planting or replanting consider using low water use flowers, trees, shrubs, and groundcovers.
    - Consider alternative landscaping techniques such as naturescaping and xeriscaping.
2. Properly store and dispose of gardening wastes.
    - Dispose of grass clippings, leaves, sticks, or other collected vegetation as garbage at a permitted landfill or by composting.
    - Do not dispose of gardening wastes in streets, waterways, or storm drainage systems.
    - Place temporarily stockpiled material away from watercourses and storm drain inlets, and berm and/or cover.
3. Use mulch or other erosion control measures on exposed soils.

[1] EPA " *Preliminary Data Summary of Urban Stormwater Best Management Practices"*

4. Properly manage irrigation and runoff.
    - Irrigate slowly or pulse irrigate so the infiltration rate of the soil is not exceeded.
    - Inspect irrigation system regularly for leaks and to ensure that excessive runoff is not occurring.
    - If re-claimed water is used for irrigation, ensure that there is no runoff from the landscaped area(s).
    - If bailing of muddy water is required (e.g. when repairing a water line leak), do not put it in the storm drain; pour over landscaped areas.
    - Use automatic timers to minimize runoff.
    - Use popup sprinkler heads in areas with a lot of activity or where pipes may be broken. Consider the use of mechanisms that reduce water flow to broken sprinkler heads.
5. Properly store and dispose of chemicals.
    - Implement storage requirements for pesticide products with guidance from the local fire department and/or County Agricultural Commissioner.
    - Provide secondary containment for chemical storage.
    - Dispose of empty containers according to the instructions on the container label.
    - Triple rinse containers and use rinse water as product.
6. Properly manage pesticide and herbicide use.
    - Follow all federal, state, and local laws and regulations governing the use, storage, and disposal of pesticides and herbicides and training of applicators and pest control advisors.
    - Follow manufacturers' recommendations and label directions.
    - Use pesticides only if there is an actual pest problem (not on a regular preventative schedule). When applicable use less toxic pesticides that will do the job. Avoid use of copper-based pesticides if possible. Use the minimum amount of chemicals needed for the job.
    - Do not apply pesticides if rain is expected or if wind speeds are above 5 mph.
    - Do not mix or prepare pesticides for application near storm drains. Prepare the minimum amount of pesticide needed for the job and use the lowest rate that will effectively control the targeted pest.
    - Whenever possible, use mechanical methods of vegetation removal rather than applying herbicides. Use hand weeding where practical.
    - Do not apply any chemicals directly to surface waters, unless the application is approved and permitted by the state. Do not spray pesticides within 100 feet of open waters.
    - Employ techniques to minimize off-target application (e.g. spray drift) of pesticides, including consideration of alternative application techniques.
    - When conducting mechanical or manual weed control, avoid loosening the soil, which could lead to erosion.
    - Purchase only the amount of pesticide that you can reasonably use in a given time period.
    - Careful soil mixing and layering techniques using a topsoil mix or composted organic material can be used as an effective measure to reduce herbicide use and watering.
7. Properly manage fertilizer use.
    - Follow all federal, state, and local laws and regulations governing the use, storage, and disposal of fertilizers.
    - Follow manufacturers' recommendations and label directions.
    - Employ techniques to minimize off-target application (e.g. spray drift) of fertilizer, including consideration of alternative application techniques. Calibrate fertilizer distributors to avoid excessive application.
    - Periodically test soils for determining proper fertilizer use.
    - Fertilizers should be worked into the soil rather than dumped or broadcast onto the surface.
    - Sweep pavement and sidewalk if fertilizer is spilled on these surfaces before applying irrigation water.
    - Use slow release fertilizers whenever possible to minimize leaching

8. Incorporate the following integrated pest management techniques where appropriate:
    - Mulching can be used to prevent weeds where turf is absent.
    - Remove insects by hand and place in soapy water or vegetable oil. Alternatively, remove insects with water or vacuum them off the plants.
    - Use species-specific traps (e.g. pheromone-based traps or colored sticky cards).
    - Sprinkle the ground surface with abrasive diatomaceous earth to prevent infestations by soft-bodied insects and slugs. Slugs also can be trapped in small cups filled with beer that are set in the ground so the slugs can get in easily.
    - In cases where microscopic parasites, such as bacteria and fungi, are causing damage to plants, the affected plant material can be removed and disposed of (pruning equipment should be disinfected with bleach to prevent spreading the disease organism).
    - Small mammals and birds can be excluded using fences, netting, and tree trunk guards.
    - Promote beneficial organisms, such as bats, birds, green lacewings, ladybugs, praying mantis, ground beetles, parasitic nematodes, trichogramma wasps, seedhead weevils, and spiders that prey on detrimental pest species.

Training

1. Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.
2. Educate and train employees on the use of pesticides and pesticide application techniques. Only employees properly trained to use pesticides can apply them.
3. Train and encourage employees to use integrated pest management techniques.
4. Train employees on proper spill containment and cleanup.
    - Establish training that provides employees with the proper tools and knowledge to immediately begin cleaning up a spill.
    - Ensure that employees are familiar with the site's spill control plan and/or proper spill cleanup procedures.
    - Fact sheet IC17 discusses Spill Prevention and Control in detail.
5. Establish a regular training schedule, train all new employees, and conduct annual refresher training.
6. Use a training log or similar method to document training.

Stencil storm drains

Storm drain system signs act as highly visible source controls that are typically stenciled directly adjacent to storm drain inlets. Stencils should read "No Dumping Drains to Ocean".

IC10. OUTDOOR LOADING/UNLOADING OF MATERIALS

Best Management Practices (BMPs)

A BMP is a technique, measure or structural control that is used for a given set of conditions to improve the quality of the stormwater runoff in a cost effective manner[1]. The minimum required BMPs for this activity are outlined in the box to the right. Implementation of pollution prevention/good housekeeping measures may reduce or eliminate the need to implement other more costly or complicated procedures. Proper employee training is key to the success of BMP implementation.

The BMPs outlined in this fact sheet target the following pollutants:

Targeted Constituents	
Sediment	x
Nutrients	x
Floatable Materials	
Metals	x
Bacteria	
Oil & Grease	x
Organics & Toxicants	x
Pesticides	x
Oxygen Demanding	

MINIMUM BEST MANAGEMENT PRACTICES

Pollution Prevention/Good Housekeeping

- Park vehicles and conduct loading/unloading only in designated loading/unloading areas so that spills or leaks can be contained.
- Clean loading/unloading areas regularly to remove potential sources of pollutants.
- Reduce exposure of materials to rain.
- Use drip pans underneath hose and pipe connections and other leak-prone spots during liquid transfer operations, and when making and breaking connections.
- Inspect equipment regularly.
- If possible, conduct loading and unloading in dry weather.

Stencil storm drains

Training

- Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.
- Provide on-going employee training in pollution prevention.

Provided below are specific procedures associated with each of the minimum BMPs along with procedures for additional BMPs that should be considered if this activity takes place at a facility located near a sensitive waterbody. In order to meet the requirements for medium and high priority facilities, the owners/operators must select, install and maintain appropriate BMPs on site. Since the selection of the appropriate BMPs is a site-specific process, the types and numbers of additional BMPs will vary for each facility.

1. Properly design loading/unloading areas to prevent storm water runon, runoff of spills, etc.
    - Grade and/or berm the area to prevent runon.
    - Position roof downspouts to direct stormwater away from the area.
    - Grade and/or berm the loading/unloading area to a drain that is connected to a dead-end.
    - The area where truck transfers take place should be paved. If the liquid is reactive with the asphalt, Portland cement should be used to pave the area.
    - Avoid placing loading/unloading areas near storm drains.
2. Park vehicles and conduct loading/unloading only in designated loading/unloading areas so that spills or leaks can be contained.
3. Clean loading/unloading areas regularly to remove potential sources of pollutants. This includes outside areas that are regularly covered by containers or other materials.
4. Reduce exposure of materials to rain.
    - Cover the loading/unloading areas.
    - If a cover is unfeasible, use overhangs, or seals or door skirts to enclose areas.
5. Use drip pans underneath hose and pipe connections and other leak-prone spots during liquid transfer operations, and when making and breaking connections.

[1] EPA " *Preliminary Data Summary of Urban Stormwater Best Management Practices"*

6. Inspect equipment regularly
    - Designate a responsible party to check under delivery vehicles for leaking fluids, spilled materials, debris, or other foreign materials.
    - Check loading/unloading equipment regularly for leaks.
7. If possible, conduct loading and unloading in dry weather.

Training

1. Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.
2. Train employees on proper spill containment and cleanup.
    - Establish training that provides employees with the proper tools and knowledge to immediately begin cleaning up a spill.
    - Ensure that employees are familiar with the site's spill control plan and/or proper spill cleanup procedures.
    - Fact sheet IC17 discusses Spill Prevention and Control in detail.
3. Train employees on the proper techniques used during liquid transfers to avoid leaks and spills.
4. Train forklift operators on the proper loading and unloading procedures.
5. Establish a regular training schedule, train all new employees, and conduct annual refresher training.
6. Use a training log or similar method to document training.

Stencil storm drains

Storm drain system signs act as highly visible source controls that are typically stenciled directly adjacent to storm drain inlets. Stencils should read "No Dumping Drains to Ocean".

IC15. PARKING AND STORAGE AREA MAINTENANCE

Best Management Practices (BMPs)

A BMP is a technique, measure or structural control that is used for a given set of conditions to improve the quality of the stormwater runoff in a cost effective manner[1]. The minimum required BMPs for this activity are outlined in the box to the right. Implementation of pollution prevention/good housekeeping measures may reduce or eliminate the need to implement other more costly or complicated procedures. Proper employee training is key to the success of BMP implementation.

MINIMUM BEST MANAGEMENT PRACTICES

Pollution Prevention/Good Housekeeping

- Conduct regular cleaning.
- Properly collect and dispose of wash water.
- Keep the parking and storage areas clean and orderly.
- Use absorbent materials and properly dispose of them when cleaning heavy oily deposits.
- When conducting surface repair work cover materials and clean paintbrushes and tools appropriately.

Stencil storm drains

Training

- Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.
- Provide on-going employee training in pollution prevention.

The BMPs outlined in this fact sheet target the following pollutants:

Targeted Constituents	
Sediment	x
Nutrients	x
Floatable Materials	x
Metals	x
Bacteria	x
Oil & Grease	x
Organics & Toxicants	x
Pesticides	x
Oxygen Demanding	x

Provided below are specific procedures associated with each of the minimum BMPs along with procedures for additional BMPs that should be considered if this activity takes place at a facility located near a sensitive waterbody. In order to meet the requirements for medium and high priority facilities, the owners/operators must select, install and maintain appropriate BMPs on site. Since the selection of the appropriate BMPs is a site-specific process, the types and numbers of additional BMPs will vary for each facility.

1. Conduct regular cleaning.
    - Sweeping or vacuuming the parking facility is encouraged over other methods.
    - Sweep all parking lots at least once before the onset of the wet season.
    - Establish frequency of sweeping based on usage and field observations of waste accumulation.
2. Properly collect and dispose of wash water.
    - Block the storm drain or contain runoff.
    - Wash water should be collected and pumped to the sanitary sewer or discharged to a pervious surface, do not allow wash water to enter storm drains. Refer to fact sheet *IC24 Wastewater Disposal* for guidance on appropriate methods for disposal of wash water to the sanitary sewer.
    - Dispose of parking lot sweeping debris and dirt at a landfill.
3. Consider use of source treatment BMPs to treat runoff.
    - Allow sheet runoff to flow into biofilters (vegetated strip and swale) and/or infiltration devices.
    - Utilize sand filters or oleophilic collectors for oily waste in low quantities.

[1] EPA " *Preliminary Data Summary of Urban Stormwater Best Management Practices"*

4. Keep the parking and storage areas clean and orderly.
    - Clean out and cover litter receptacles frequently to prevent spillage.
    - Remove debris in a timely fashion.

    OPTIONAL:
    - Post "No Littering" signs.
5. When cleaning heavy oily deposits:
    - If possible, clean oily spots with absorbent materials.
    - Do not allow discharges to the storm drain.
    - Appropriately dispose of spilled materials and absorbents.
6. When conducting surface repair work:
    - Pre-heat, transfer or load hot bituminous material away from storm drain inlets.
    - Conduct surface repair work during dry weather to prevent contamination from contacting stormwater runoff.
    - Cover and seal nearby storm drain inlets (with waterproof material or mesh) and manholes before applying seal coat, slurry seal, etc. Leave covers in place until job is complete and clean any debris for proper disposal.
    - To avoid runoff, use only as much water as necessary for dust control.
    - Use drip pans or absorbent material to catch drips from paving equipment that is not in use. Dispose of collected material and absorbents properly.
7. Conduct inspections on a regular basis.
    - Designate personnel to conduct inspections of the parking facilities and stormwater conveyance systems associated with them.
    - Inspect cleaning equipment/sweepers for leaks on a regular basis.
8. Keep accurate maintenance logs to evaluate materials removed/stored and improvements made.
9. Arrange rooftop drains to prevent drainage directly onto paved surfaces.

Training

1. Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.
2. Train employees on proper spill containment and cleanup.
    - Establish training that provides employees with the proper tools and knowledge to immediately begin cleaning up a spill.
    - Ensure that employees are familiar with the site's spill control plan and/or proper spill cleanup procedures.
    - Fact sheet IC17 discusses Spill Prevention and Control in detail.
3. Provide regular training to field employees and/or contractors regarding cleaning of paved areas and proper operation of equipment.
4. Establish a regular training schedule, train all new employees, and conduct annual refresher training.
5. Use a training log or similar method to document training.

Stencil storm drains

Storm drain system signs act as highly visible source controls that are typically stenciled directly adjacent to storm drain inlets. Stencils should read "No Dumping Drains to Ocean".

IC16. POOL AND FOUNTAIN CLEANING

Best Management Practices (BMPs)

A BMP is a technique, measure or structural control that is used for a given set of conditions to improve the quality of the stormwater runoff in a cost effective manner[1]. The minimum required BMPs for this activity are outlined in the box to the right. Implementation of pollution prevention/good housekeeping measures may reduce or eliminate the need to implement other more costly or complicated procedures. Proper employee training is key to the success of BMP implementation.

MINIMUM BEST MANAGEMENT PRACTICES

Pollution Prevention/Good Housekeeping

- Prevent algae problems with regular cleaning, consistent adequate chlorine levels, and well-maintained water filtration and circulation systems.
- Discharge pool and fountain water properly.

Stencil storm drains

Training

- Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.
- Provide on-going employee training in pollution prevention.

The BMPs outlined in this fact sheet target the following pollutants:

Targeted Constituents	
Sediment	x
Nutrients	x
Floatable Materials	x
Metals	
Bacteria	x
Oil & Grease	
Organics & Toxicants	x
Pesticides	x
Oxygen Demanding	x

Provided below are specific procedures associated with each of the minimum BMPs along with procedures for additional BMPs that should be considered if this activity takes place at a facility located near a sensitive waterbody. In order to meet the requirements for medium and high priority facilities, the owners/operators must select, install and maintain appropriate BMPs on site. Since the selection of the appropriate BMPs is a site-specific process, the types and numbers of additional BMPs will vary for each facility.

1. Prevent algae problems with regular cleaning, consistent adequate chlorine levels, and well-maintained water filtration and circulation systems.
    - Do not use copper-based algaecides.
    - Control algae with chlorine or other alternatives, such as sodium bromide.
2. Manage pH and water hardness to minimize corrosion of copper pipes.
3. Discharge pool and fountain water properly. Consider hiring a professional pool-draining service to collect all pool water for off-site disposal. If this is not feasible, adhere to the following:
    - When draining pools or fountains never discharge water to a street or storm drain, discharge to the sanitary sewer if permitted to do so. Refer to fact sheet *IC24 Wastewater Disposal* for guidance on appropriate methods for disposal of wash water to the sanitary sewer.
    - If draining a pool to the sanitary sewer, prevent backflow by maintaining an "air gap" between the discharge line and the sewer line (do not seal the connection between the hose and sewer line). Be sure to call the local sewer authority for guidance on flow rate restrictions, backflow prevention, and handling special cleaning waste (such as acid wash). Keep discharge flows to the low levels. Higher flow rates may be prohibited by local ordinance.

[1] EPA " *Preliminary Data Summary of Urban Stormwater Best Management Practices"*

- If water is dechlorinated with a neutralizing chemical or by allowing chlorine to dissipate for a few days (do not use the facility during this time), the water may be recycled/reused by draining it gradually onto a landscaped area. Water must be tested prior to discharge to ensure that chlorine is not present.
- Provide drip pans or buckets beneath drain pipe connections to catch leaks. This will be especially pertinent if pool or spa water that has not been dechlorinated is pumped through piping to a discharge location.

4. Properly clean and/or dispose of filters.
    - Never clean a filter in the street or near a storm drain.
    - Rinse cartridge filters onto a dirt area, and work filter residue into soil.
    - Backwash diatomaceous earth filters onto dirt. Dispose of spent diatomaceous earth in the garbage. Diatomaceous earth cannot be discharged to surface waters, storm drainage systems, septic systems, or on the ground.
    - If there is not a suitable dirt area, discharge filter backwash or rinsewater to the sanitary sewer if permitted to do so by the local sewering agency.

Training

1. Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.
2. Train employees on proper spill containment and cleanup.
    - Establish training that provides employees with the proper tools and knowledge to immediately begin cleaning up a spill.
    - Ensure that employees are familiar with the site's spill control plan and/or proper spill cleanup procedures.
    - Fact sheet IC17 discusses Spill Prevention and Control in detail.
3. Train maintenance personnel on the proper techniques for testing chlorine levels and applying neutralizing chemicals.
4. Establish a regular training schedule, train all new employees, and conduct annual refresher training.
5. Use a training log or similar method to document training.

Stencil storm drains

Storm drain system signs act as highly visible source controls that are typically stenciled directly adjacent to storm drain inlets. Stencils should read "No Dumping Drains to Ocean".

IC17. SPILL PREVENTION AND CLEANUP

Best Management Practices (BMPs)

A BMP is a technique, measure or structural control that is used for a given set of conditions to improve the quality of the stormwater runoff in a cost effective manner[1]. The minimum required BMPs for this activity are outlined in the box to the right. Implementation of pollution prevention/good housekeeping measures may reduce or eliminate the need to implement other more costly or complicated procedures. Proper employee training is key to the success of BMP implementation.

MINIMUM BEST MANAGEMENT PRACTICES

Pollution Prevention/Good Housekeeping

- Develop procedures to prevent/mitigate spills to storm drain systems.
- Post "No Dumping" signs with a phone number for reporting illegal dumping and disposal.
- Conduct routine cleaning, inspections, and maintenance.
- Properly store and handle chemical materials.
- Protect materials stored outside from stormwater runon.
- Secure drums stored in an area where unauthorized persons may gain access to prevent accidental spillage, pilferage, or any unauthorized use.
- Identify key spill response personnel.
- Clean up leaks and spills immediately.
- Report and track spills.

Stencil storm drains

Training

- Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.
- Provide on-going employee training in pollution prevention.

The BMPs outlined in this fact sheet target the following pollutants:

Targeted Constituents	
Sediment	x
Nutrients	x
Floatable Materials	x
Metals	x
Bacteria	x
Oil & Grease	x
Organics & Toxicants	x
Pesticides	x
Oxygen Demanding	x

Provided below are specific procedures associated with each of the minimum BMPs along with procedures for additional BMPs that should be considered if this activity takes place at a facility located near a sensitive waterbody. In order to meet the requirements for medium and high priority facilities, the owners/operators must select, install and maintain appropriate BMPs on site. Since the selection of the appropriate BMPs is a site-specific process, the types and numbers of additional BMPs will vary for each facility.

Spill Prevention

1. Develop procedures to prevent/mitigate spills to storm drain systems.
   Standardize reporting procedures, containment, storage, and disposal activities, documentation, and follow-up procedures.
2. Post "No Dumping" signs with a phone number for reporting illegal dumping and disposal.
3. Conduct routine cleaning, inspections, and maintenance
   - Sweep and clean storage areas consistently at a designated frequency (e.g. weekly, monthly). DO NOT hose down areas to storm drains.
   - Place drip pans or absorbent materials beneath all mounted taps, and at all potential drip and spill locations during filling and unloading of tanks. Reuse, recycle, or properly dispose of any collected liquids or soiled absorbent materials.
   - Check tanks (and any containment sumps) frequently for leaks and spills. Replace tanks that are leaking, corroded, or otherwise deteriorating with tanks in good condition. Collect all spilled liquids and properly dispose of them.

[1] EPA " *Preliminary Data Summary of Urban Stormwater Best Management Practices"*

- Check for external corrosion of material containers, structural failures, spills and overfills due to operator error, failure of piping system, etc.
- Inspect tank foundations, connections, coatings, and tank walls and piping system.

4. Properly store and handle chemical materials.
    - Designate a secure material storage area that is paved with Portland cement concrete, free of cracks and gaps, and impervious in order to contain leaks and spills.
    - Do not store chemicals, drums, or bagged materials directly on the ground. Place these items in secondary containers.
    - Keep chemicals in their original containers, if feasible.
    - Keep containers well labeled according to their contents (e.g., solvent, gasoline).
    - Label hazardous substances regarding the potential hazard (corrosive, radioactive, flammable, explosive, poisonous).
    - Prominently display required labels on transported hazardous and toxic materials (per US DOT regulations).
5. Utilize secondary containment systems for liquid materials.
    - Surround storage tanks with a berm or other secondary containment system.
    - Slope the area inside the berm to a drain.
    - Drain liquids to the sanitary sewer if available. DO NOT discharge wash water to sanitary sewer until contacting the local sewer authority to find out if pretreatment is required
    - Pass accumulated stormwater in petroleum storage areas through an oil/water separator.
    - Use catch basin filtration inserts.
6. Protect materials stored outside from stormwater runon. Construct a berm around the perimeter of the material storage area to prevent the runon of uncontaminated stormwater from adjacent areas as well as runoff of stormwater from the material.
7. Secure drums stored in an area where unauthorized persons may gain access to prevent accidental spillage, pilferage, or any unauthorized use.

Spill Control and Cleanup Activities

8. Identify key spill response personnel.
9. Adopt the Orange County Hazardous Materials Area Plan or an equivalent plan, which includes a set of planned responses to hazardous materials emergencies. The plan should include:
    - Description of the facility, owner and address, activities and chemicals present
    - Facility map
    - Notification and evacuation procedures
    - Cleanup instructions
    - Identification of responsible departments
10. Clean up leaks and spills immediately.
    - Place a stockpile of spill cleanup materials where they will be readily accessible (e.g. near storage and maintenance areas).
    - Utilize dry cleaning methods to clean up spills to minimize the use of water. Use a rag for small spills, a damp mop for general cleanup, and absorbent material for larger spills. If the spilled material is hazardous, then used cleanup materials are also hazardous and must be sent to a certified laundry (rags) or disposed of as hazardous waste. Physical methods for the cleanup of dry chemicals include the use brooms, shovels, sweepers, or plows.
    - Never hose down or bury dry material spills. Sweep up the material and dispose of properly.
    - Clean up chemical materials with absorbents, gels, and foams. Use adsorbent materials on small spills rather than hosing down the spill. Remove the adsorbent materials promptly and dispose of properly.
    - For larger spills, a private spill cleanup company or Hazmat team may be necessary.

11. Reporting
    1. Report spills that pose an immediate threat to human health or the environment to local agencies, such as the fire department, and the Regional Water Quality Control Board.
    2. Establish a system for tracking incidents. The system should be designed to identify the following:
        - Types and quantities (in some cases) of wastes
        - Patterns in time of occurrence (time of day/night, month, or year)
        - Mode of dumping (abandoned containers, "midnight dumping" from moving vehicles, direct dumping of materials, accidents/spills)
        - Responsible parties
    3. Federal regulations require that any oil spill into a water body or onto an adjoining shoreline be reported to the National Response Center (NRC) at 800-424-8802 (24 hour).

Training
1. Educate employees about spill prevention and cleanup.
    - Establish training that provides employees with the proper tools and knowledge to immediately begin cleaning up a spill.
    - Educate employees on aboveground storage tank requirements.
    - Train all employees upon hiring and conduct annual refresher training.
2. Train employees responsible for aboveground storage tanks and liquid transfers on the Spill Prevention Control and Countermeasure Plan.

Stencil storm drains

Storm drain system signs act as highly visible source controls that are typically stenciled directly adjacent to storm drain inlets. Stencils should read "No Dumping Drains to Ocean".

IC21. WASTE HANDLING AND DISPOSAL

Best Management Practices (BMPs)

A BMP is a technique, measure or structural control that is used for a given set of conditions to improve the quality of the stormwater runoff in a cost effective manner[1]. The minimum required BMPs for this activity are outlined in the box to the right. Implementation of pollution prevention/good housekeeping measures may reduce or eliminate the need to implement other more costly or complicated procedures. Proper employee training is key to the success of BMP implementation.

MINIMUM BEST MANAGEMENT PRACTICES

Pollution Prevention/Good Housekeeping

- Prevent waste materials from coming in direct contact with wind or rain. .
- Keep waste collection areas clean.
- Secure solid waste containers when not in use.
- Regularly inspect, repair, and/or replace waste containers.
- Use all of a product before disposing of the container.
- Label and store hazardous wastes according to hazardous waste regulations.

Stencil storm drains

Training

- Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.
- Provide on-going employee training in pollution prevention.

The BMPs outlined in this fact sheet target the following pollutants:

Targeted Constituents	
Sediment	x
Nutrients	x
Floatable Materials	x
Metals	x
Bacteria	x
Oil & Grease	x
Organics & Toxicants	x
Pesticides	x
Oxygen Demanding	x

Provided below are specific procedures associated with each of the minimum BMPs along with procedures for additional BMPs that should be considered if this activity takes place at a facility located near a sensitive waterbody. In order to meet the requirements for medium and high priority facilities, the owners/operators must select, install and maintain appropriate BMPs on site. Since the selection of the appropriate BMPs is a site-specific process, the types and numbers of additional BMPs will vary for each facility.

1. Prevent waste materials from coming in direct contact with wind or rain.
    - Cover the waste management area with a permanent roof.
    - If this is not feasible, cover waste piles with temporary covering material such as reinforced tarpaulin, polyethylene, polyurethane, polypropylene, or hypalon.
    - Cover dumpsters to prevent rain from washing out waste materials.
2. Design waste handling and disposal area to prevent stormwater runon.
    - Enclose the waste handling and disposal area or build a berm around it.
    - Position roof downspouts to direct stormwater away from waste handling and disposal area.
3. Design waste handling and disposal area to contain spills.
    - Place dumpsters or other waste receptacles on an impervious surface.
    - Construct a berm around the area to contain spills.
    - Install drains connected to the public sewer or the facility's process wastewater system within these contained areas. DO NOT discharge to a public sewer until contacting the local sewer authority to find out if pretreatment is required.

[1] EPA " *Preliminary Data Summary of Urban Stormwater Best Management Practices"*

4. Keep waste collection areas clean.
    - When cleaning around waste handling and disposal areas use dry methods when possible (e.g. sweeping, use of absorbents).
    - If water must be used, collect water and discharge to the sewer if permitted to do so. DO NOT discharge to a public sewer until contacting the local sewer authority to find out if pretreatment is required. If discharge to the sanitary sewer is not allowed, pump water to a tank and dispose of properly.
    - Post "No Littering" signs.
5. Secure solid waste containers when not in use.
6. Regularly inspect, repair, and/or replace waste containers.
7. Do not fill waste containers with washout water or any other liquid.
8. Use all of a product before disposing of the container.
9. Segregate wastes by type and label and date wastes.
    - Do not mix wastes; this can cause chemical reactions, make recycling impossible, and complicate disposal.
    - Ensure that only appropriate solid wastes are added to solid waste containers.
    - Certain wastes such as hazardous wastes, appliances, fluorescent lamps, pesticides, etc. may not be disposed of in solid waste containers.
10. Label and store hazardous wastes according to hazardous waste regulations.
    - Consult your local hazardous waste agency or Fire Department for details.
    - Obtain a hazardous waste generator license or permit if necessary.
12. Minimize waste.
    - Recycle materials whenever possible.
    - Modify processes or equipment to increase efficiency.
    - Identify and promote use of non-hazardous alternatives.
    - Reduction in the amount of waste generated can be accomplished using many different types of source controls such as:
        - Production planning and sequencing
        - Process or equipment modification
        - Raw material substitution or elimination
        - Loss prevention and housekeeping
        - Waste segregation and separation
        - Close loop recycling
    - Establish a material tracking system to increase awareness about material usage. This may reduce spills and minimize contamination, thus reducing the amount of waste produced.

Training

1. Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.
2. Train employees in proper waste handling and disposal.
3. Train employees on proper spill containment and cleanup.
    - Establish training that provides employees with the proper tools and knowledge to immediately begin cleaning up a spill.
    - Ensure that employees are familiar with the site's spill control plan and/or proper spill cleanup procedures.
    - Fact sheet IC17 discusses Spill Prevention and Control in detail.

4. Establish a regular training schedule, train all new employees, and conduct annual refresher training.
5. Use a training log or similar method to document training.

Stencil storm drains

Storm drain system signs act as highly visible source controls that are typically stenciled directly adjacent to storm drain inlets. Stencils should read “No Dumping Drains to Ocean”.

Gentlemen:

In accordance with your request, we have conducted a geotechnical feasibility study at the subject site. We are pleased to present this report summarizing the conclusions and recommendations developed from our investigation.

We sincerely appreciate the opportunity to be of service on this project. We look forward to providing additional consulting services during the course of the project. If we may be of further assistance in any manner, please contact our office.

Respectfully Submitted,

1.0 EXECUTIVE SUMMARY

Presented below is a brief summary of the conclusions and recommendations of this investigation. Since this summary is not all inclusive, it should be read in complete context with the entire report. It should be noted that this investigation was focused on determining the geotechnical feasibility of the proposed development. **This report is not a design-level investigation. Future studies, potentially including additional subsurface exploration, will be necessary to refine the preliminary design parameters that are presented within this report**.

Geotechnical Design Considerations

- Undocumented fill soils at borings drilled within the development area extend to depths of 5 to 10± feet below the existing site grades. The existing fill soils possess variable composition and strength, and are considered to represent undocumented fill. The results of laboratory testing indicate that some of the near-surface soils are compressible when loaded.
- The fill soils are underlain by high strength native terrace deposits.
- The proposed development is considered to be feasible with respect to the geotechnical conditions encountered at the boring locations at the site. The proposed structures will have relatively high column loads. The most feasible means of supporting the new structures is considered to be the use of shallow foundations supported within the terrace deposits. In any areas where the foundations do not extend into the terrace deposits, remedial grading will be necessary to remove and replace the existing undocumented fill soils.
- The proposed development includes two sections of office building that will be constructed over existing retail buildings. These structures will likely require deep foundations to reduce the impact to the existing retail tenants, and to avoid surcharging the foundations of the existing buildings.
- Based on the results of corrosivity testing, the on-site soils are considered to be corrosive to ductile iron and cast iron pipe.

Preliminary Site Preparation Recommendations

- Demolition of several structures associated with the existing development and areas of existing pavements will be required in order to facilitate construction of the new buildings. Debris resultant from demolition should be disposed of off-site. Alternatively, concrete and asphalt debris may be pulverized to a maximum 2-inch particle size, well mixed with the on-site soils, and incorporated into new structural fills or it may be crushed and made into crushed miscellaneous base (CMB).
- Preliminarily, the overexcavation within the building areas is recommended to extend to depths of at least 2 to 3 feet below existing and proposed building pad subgrade elevations, to provide a suitable floor slab subgrade. No specific overexcavation is expected to be necessary where foundations extend into the terrace deposits. Where foundations are not extended into the terrace deposits, overexcavation should be performed to remove all of the existing undocumented fill soils, and to a depth of at least 3 to 5 feet below bearing grade within the influence zones of any new foundations. These recommendations are subject to review and may be revised based on the results of the design-level geotechnical investigation.
- Preliminarily, the new parking area subgrade soils are recommended to be scarified to a depth of 12± inches, thoroughly moisture conditioned to within 2 to 4 percent above the optimum

moisture content and recompacted to at least 90 percent of the ASTM D-1557 maximum dry density.

Preliminary Foundation Design Recommendations

- Conventional shallow foundations, supported in newly placed compacted fill.
- 4,000 to 5,000 lbs/ft^2 maximum allowable soil bearing pressure for footings supported in dense to very dense terrace deposits.
- 2,500 to 3,000 lbs/ft^2 maximum allowable soil bearing pressure for footings supported in structural fill.
- The design of the foundations will depend on the results of the future design-level geotechnical study. Minimum recommended reinforcement based on geotechnical conditions is expected to consist of four (4) No. 5 rebars (2 top and 2 bottom) in strip footings. Additional reinforcement may be necessary for structural considerations.

Preliminary Floor Slab Design Recommendations

- Conventional slabs-on-grade, minimum 5 to 6 inches thick.
- Steel reinforcement is expected to be necessary, based on the presence of expansive soils.
- The design of the floor slabs will depend on the results of the future design-level geotechnical study. The actual thickness and reinforcement of the floor slabs should be determined by the structural engineer.

Preliminary Pavement Design Recommendations

ASPHALT PAVEMENTS (R = 10)

2.0 SCOPE OF SERVICES

The scope of services performed for this project was in general accordance with our Proposal No. 20P269, dated June 29, 2020. The scope of services included a visual site reconnaissance, subsurface exploration, field and laboratory geotechnical testing, and geotechnical engineering analysis to determine the geotechnical feasibility of the proposed development. This report also contains preliminary design criteria for building foundations, building floor slabs, and parking lot pavements. The evaluation of the environmental aspects of this site was beyond the scope of services for this feasibility study.

It should be noted that additional subsurface exploration, laboratory testing and engineering analysis will be necessary to provide a design-level geotechnical report, with specific foundation, floor slab, and grading recommendations for the new structures.

3.0 SITE AND PROJECT DESCRIPTION

3.1 Site Conditions

Brea Plaza Center is located at the northwest corner of Imperial Highway and Associated Road, in Brea, California. The overall site is bounded to the north by existing single-family residences, to the west by the 57 freeway, to the south by Imperial Highway, and to the east by Associated Road. The general location of the site is illustrated on the Site Location Map, enclosed as Plate 1 in Appendix A of this report.

Brea Plaza is a retail shopping center, approximately 15 acres in size. The specific subject site is a roughly L-shaped area, 2.7± acres in size, located in the western region of Brea Plaza, adjacent to the 57 Freeway. The subject site is presently developed with a Buca de Beppo restaurant, a Custom Comfort Mattress store, a movie theater, and a multi-tenant retail building. The remainder of the subject site is covered by asphaltic concrete (AC) pavements that are used for automobile and truck parking and drive lanes. Limited areas of the subject site are paved with Portland cement concrete (PCC) pavements. Concrete flatwork and landscaped planters are located throughout the existing development. The remaining areas of the Brea Plaza Center are developed with similar retail and restaurant buildings and AC pavements.

Topographic information for the site was obtained from a site plan provided by Architects Orange. The site topography slopes from the northwest corner towards the southeast. The elevation at the subject site generally ranges from 336± feet mean sea level (msl) in the northern region of the subject site to 329± feet msl in the southern region.

3.2 Proposed Development

A preliminary site plan was provided to our office by the client. The site will be developed with several new structures including a hotel, residential apartments, a restaurant, a self-storage building and an office building. The hotel will be located in the southwestern region of the site, will have a footprint of 15,000 to 20,000± ft² and will be 6 stories in height. The restaurant will be incorporated into the first story of the hotel. The apartment building will be located in the northern region of the site, and will have a footprint of 45,000± ft². This building will be a total of 7 stories in height, with the lower two levels consisting of a parking structure. The self-storage facility will be incorporated into the residential building. Two areas of new offices will be constructed over portions of the existing multi-tenant retail building and the Custom Comfort Mattress store. The office building will be 3 stories in height, with a footprint of 8,000± ft². The existing movie theater and Buco de Beppo restaurant will be demolished as part of the redevelopment. The buildings will be surrounded by asphaltic concrete or Portland cement concrete pavements for automobile parking and drive lanes. The proposed development is also expected to include some areas of concrete flatwork and landscape planters.

Preliminary structural information was obtained from the project structural engineer, Ficcadenti, Waggoner and Castle (FWC). We understand that the first floor of the hotel structure will consist

of a concrete podium below 5 levels of wood-frame construction. The residential building will be 2 levels of concrete podium and 5 levels of wood frame construction. The two sections of office building will consist of steel frame construction. New foundations will be required within the existing multi-tenant retail building that will remain in place below the new office building. Preliminary information provided by FWC indicates that typical maximum column loads for the proposed structures will be as follows:

ESTIMATED COLUMN LOADS

Structure	Dead Load	Sustained Live Load	Transient Live Load
Residential Building	625 kips	45 kips	180 kips
Hotel Building	475 kips	35 kips	140 kips
Office Building	350 kips	60 kips	90 kips

FWC has indicated that some isolated foundations may have slightly higher loads.

No significant amounts of below-grade construction, such as basements or crawl spaces, are expected to be included in the proposed development. Based on the assumed topography, cuts and fills of up to 3 to 6± feet are expected to be necessary to achieve the proposed site grades.

3.3 Previous Studies

Southern California Geotechnical, Inc. (SCG) was provided with a copy of a previous study conducted for the overall site by Pacific Soils Engineering (PSE). This document was prepared for storm drain improvements that have since been constructed in the eastern region of the Brea Plaza site. The report also included a summary of data collected during previous investigations at the site. A summary of the relevant information pertaining to the subject site from this document is presented below:

> Preliminary Geotechnical Investigation, Proposed Storm Drain Improvements for the Loftus Diversion Channel and the Brea Plaza Shopping Center, Northwest Corner of Imperial Highway and Associated Road, City of Brea, California, Prepared by Pacific Soils Engineering, Inc., dated March 26, 2008, Work Order 500690.

The overall subsurface exploration for this project consisted of thirteen (13) borings and ten (10) cone penetration tests. Boring Nos. HS-03, HS-04, HS-05, and HS-07, as well as CPT Nos. CPT-1, CPT-3, and CPT-4 were within the area of the specific subject site and will be the focus of this summary. The borings were advanced to depths of up to 21½ to 31½± feet below the existing site grades. Engineered fill soils were reportedly encountered beneath the pavements at several of the boring locations. It should be noted that PSE did not provide any documentation to confirm that the existing fill soils were monitored and tested during placement. The fill soils extended to depths of up to 2 to 10± feet below grade at these boring locations, and generally consisted of medium dense to dense medium dense to dense clayey sand, silty sand and sandy clay. Beneath the fill materials, all of the borings encountered terrace deposits, extending to at least the maximum depth explored of 31± feet. The terrace deposits generally consisted of stiff to hard sandy clay, dense to very dense sandy silt, silty sand, and clayey sand. Occasional layers of

gravelly sand and clayey silt were encountered. The results of expansion index testing performed for this report identified low to highly expansive soils at the boring locations. Ground water was encountered at most borings at depths between 10 and 30± feet (El. 303±). The report also notes that layers of perched groundwater were encountered during the investigation.

In Appendix D of this report, a previous report performed for the subject site was reviewed and summarized:

> Geotechnical Investigation, Proposed Shopping Center, Imperial Highway at Orange Freeway, Brea, California, Prepared by Converse Davis Dixon Associates, dated July 21, 1975, Project No. A-75-587-A.

The exploration for this investigation consisted of 12 borings advanced to depths of 3 to 30± feet below the site grades. The borings were advanced with a truck-mounted, rotary drilling machine equipped with a 16 to 20-inch diameter drilling bucket. Boring Nos. CD BH-3 through CD BH-5 are located within the subject site. Native alluvial soils were encountered at the ground surface of these 3 borings. The near surface alluvium within the upper 6½± feet generally consisted of stiff to very stiff clay and silty clay. Deeper alluvial soils, extending to at least 20± feet below ground surface, generally consisted of medium dense to very dense silty sand, sandy silt and silt. Occasional layers of very stiff/very dense sandy clay and clayey sand were encountered. Swell tests were conducted on Boring Nos. CD BH-3 and CD BH-5, results showed a 9.7 and 7.7 percent swell, respectively. No groundwater was encountered during the drilling of the relevant borings.

The relevant boring logs and lab data from the previous geotechnical reports are included in Appendix F of this report.

4.0 SUBSURFACE EXPLORATION

4.1 Scope of Exploration/Sampling Methods

The subsurface exploration conducted for this project consisted of four (4) borings (identified as Boring Nos. B-1 through B-4) advanced to depths of 25 to 50± feet below the existing site grades. All of the borings were logged during drilling by a member of our staff.

The borings were advanced with hollow-stem augers by a conventional truck-mounted drilling rig. Representative bulk and relatively undisturbed soil samples were taken during drilling. Relatively undisturbed soil samples were taken with a split barrel "Modified California Sampler" containing a series of one inch long, 2.416± inch diameter brass rings. This sampling method is described in ASTM Test Method D-3550. In-situ samples were also taken using a 1.4± inch inside diameter split spoon sampler, in general accordance with ASTM D-1586. At all of the boring locations these samplers are driven into the ground with successive blows of a 140-pound weight falling 30 inches. The blow counts obtained during driving are recorded for further analysis. Bulk samples were collected in plastic bags to retain their original moisture content. The relatively undisturbed ring samples were placed in molded plastic sleeves that were then sealed and transported to our laboratory.

The approximate locations of the borings are indicated on the Boring Location Plan, included as Plate 2 in Appendix A of this report. The Boring Logs, which illustrate the conditions encountered at the boring locations, as well as the results of some of the laboratory testing, are included in Appendix B.

4.2 Geotechnical Conditions

Pavements

Asphaltic concrete pavements were encountered at the ground surface of all boring locations. The pavement sections at these locations generally consists of 3 to 8± inches of AC underlain by 5 to 7± inches of crushed aggregate base.

Artificial Fill

Artificial fill soils were encountered beneath the pavements at Boring Nos. B-2 through B-4, extending to depths of 5½ to 6½± feet below the existing site grades. The artificial fill soils generally consist of medium dense to very dense silty fine sand with trace clay nodules and clayey fine sand, as well as stiff to hard silty clay and fine sandy clay. The fill soils possess a disturbed and mottled appearance with occasional artificial debris content (including fragments of wood, brick and asphaltic concrete) resulting in their classification as artificial fill.

Additional soils classified as possible fill were encountered beneath the pavement at Boring No. B-1 and beneath the fill at Boring No. B-4, extending to depths of 5½ to 8½± feet below ground surface. These soils possess similar characteristics to the fill soils, but lack any obvious indicators of fill such as brick or asphaltic concrete fragments.

Terrace Deposits

Native terrace deposits were encountered beneath the fill and/or possible fill soils at all of the boring locations, extending to at least the maximum depth explored of 50± feet below ground surface. The near surface terrace deposits (within the upper 5½ to 22± feet) generally consist of medium dense to very dense fine sand, silty fine sand and occasionally fine sandy silt. Terrace deposits extending deeper than 22± feet generally consist of very stiff to hard silty clay and fine sandy clay, as well as medium dense to very dense fine sand. Occasional layers of medium dense to dense clayey silt and silty fine sand were encountered. Trace to some calcareous nodules were observed in some of the terrace deposits. Boring No. B-1 encountered a fine to coarse sand layer at depths of 17 to 25± feet.

Groundwater

Free water was encountered during the drilling of all boring locations, at depths of 22½ to 23½± feet. A delayed groundwater level reading was taken at Boring No. B-2, 3± hours after the completion of the boring. At this boring location, water was present at a depth of 22½± feet below ground surface during the final measurement. Based on the moisture contents of the recovered soil samples and the delayed water measurements taken within the open boreholes, the static groundwater table is considered to have been present at depths of 22½± feet below the existing site grades at the time of the subsurface investigation.

As part of our research, we reviewed readily available groundwater data in order to determine regional groundwater depths. Recent water level data was obtained from the California State Water Resources Control Board, GeoTracker, website, http://geotracker.waterboards.ca.gov/. The nearest monitoring well on record is located approximately 475 feet southeast of the site. Water level readings within this monitoring well indicate a high groundwater level of 18± feet below the ground surface, in December 2011.

The Seismic Hazard Zone Report for the La Habra Quadrangle (SHZR 09), published by the California Geological Survey (CGS), includes a map of historic high groundwater depths. This map indicates a historic high water depth of 10 to 20 feet below grade in the vicinity of the subject site

5.0 LABORATORY TESTING

The soil samples recovered from the subsurface exploration were returned to our laboratory for further testing to determine selected physical and engineering properties of the soils. The tests are briefly discussed below. It should be noted that the test results are specific to the actual samples tested, and variations could be expected at other locations and depths.

Classification

All recovered soil samples were classified using the Unified Soil Classification System (USCS), in accordance with ASTM D-2488. The field identifications were then supplemented with additional visual classifications and/or by laboratory testing. The USCS classifications are shown on the Boring Logs and are periodically referenced throughout this report.

Dry Density and Moisture Content

The density has been determined for selected relatively undisturbed ring samples. These densities were determined in general accordance with the method presented in ASTM D-2937. The results are recorded as dry unit weight in pounds per cubic foot. The moisture contents are determined in accordance with ASTM D-2216, and are expressed as a percentage of the dry weight. These test results are presented on the Boring Logs.

Consolidation

Selected soil samples have been tested to determine their consolidation potential, in accordance with ASTM D-2435. The testing apparatus is designed to accept either natural or remolded samples in a one-inch-high ring, approximately 2.416 inches in diameter. Each sample is then loaded incrementally in a geometric progression and the resulting deflection is recorded at selected time intervals. Porous stones are in contact with the top and bottom of the sample to permit the addition or release of pore water. The samples are typically inundated with water at an intermediate load to determine their potential for collapse or heave. The results of the consolidation testing are plotted on Plates C-1 through C-8 in Appendix C of this report.

Consolidation tests were performed by PSE on several soil samples. The results of tests performed on borings located within the current development area are included in Appendix F of this report.

Maximum Dry Density and Optimum Moisture Content

A representative bulk sample was tested for its maximum dry density and optimum moisture content. The results have been obtained using the Modified Proctor procedure, per ASTM D-1557. These tests are generally used to compare the in-situ densities of undisturbed field samples, and for later compaction testing. Additional testing of other soil type or soil mixes may be necessary at a later date. The results of the testing are plotted on Plate C-9 in Appendix C of this report.

A maximum dry density test was also performed by PSE on a sample of soil from their boring HS-03. This test indicated a maximum dry density of 121.5 lbs/ft^3 and an optimum moisture content of 9.8 percent.

Soluble Sulfates

Representative samples of the near-surface soil were submitted to a subcontracted analytical laboratory for determination of soluble sulfate content. Soluble sulfates are naturally present in soils, and if the concentration is high enough, can result in degradation of concrete which comes into contact with these soils. The results of the soluble sulfate testing are presented below, and are discussed further in a subsequent section of this report.

Sample Identification	Soluble Sulfates (%)	Sulfate Classification
B-1 @ 0 to 5 feet	0.004	Not Applicable (S0)
B-3 @ 0 to 5 feet	0.013	Not Applicable (S0)

Corrosivity Testing

Representative bulk samples of the near-surface soils were submitted to a subcontracted corrosion engineering laboratory to identify potentially corrosive characteristics with respect to common construction materials. The corrosivity testing included a determination of the electrical resistivity, pH, and chloride and nitrate concentrations of the soils, as well as other tests. The results of some of these tests are presented below.

Sample Identification	Saturated Resistivity (ohm-cm)	pH	Chlorides (mg/kg)	Nitrates (mg/kg)
B-1 @ 0 to 5 feet	1,440	7.9	4	6
B-3 @ 0 to 5 feet	1,040	7.7	106	28

Expansion Index

The expansion potential of the on-site soils was determined in general accordance with ASTM D-4829 as required by the California Building Code (CBC). The testing apparatus is designed to accept a 4-inch-diameter, 1-inch high, remolded sample. The sample is initially remolded to 50± 1 percent saturation and then loaded with a surcharge equivalent to 144 pounds per square foot. The sample is then inundated with water, and allowed to swell against the surcharge. The resultant swell or consolidation is recorded after a 24-hour period. The result of the EI testing are as follows:

Sample Identification	Expansion Index	Expansive Potential
B-1 @ 0 to 5 feet	55	Medium
B-3 @ 0 to 5 feet	38	Low
Pacific Soils HS-03	45	Low
Pacific Soils HS-07	46	Low

6.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the results of our review, field exploration, laboratory testing and geotechnical analysis, the proposed development is considered feasible from a geotechnical standpoint. **Based on the preliminary nature of this investigation, further geotechnical investigation may be required prior to construction of the proposed development.** The recommendations contained in this report should be taken into the design, construction, and grading considerations. The recommendations are contingent upon all grading and foundation construction activities being monitored by the geotechnical engineer of record.

The Grading Guide Specifications, included as Appendix D, should be considered part of this report, and should be incorporated into the project specifications. The contractor and/or owner of the development should bring to the attention of the geotechnical engineer any conditions that differ from those stated in this report, or which may be detrimental for the development.

6.1 Seismic Design Considerations

The subject site is located in an area which is subject to strong ground motions due to earthquakes. The performance of a site specific seismic hazards analysis was beyond the scope of this investigation. However, numerous faults capable of producing significant ground motions are located near the subject site. Due to economic considerations, it is not generally considered reasonable to design a structure that is not susceptible to earthquake damage. Therefore, significant damage to structures may be unavoidable during large earthquakes. The proposed structures should, however, be designed to resist structural collapse and thereby provide reasonable protection from serious injury, catastrophic property damage and loss of life.

Faulting and Seismicity

Research of available maps indicates that the subject site is not located within an Alquist-Priolo Earthquake Fault Zone. Furthermore, Southern California Geotechnical (SCG) did not identify any evidence of faulting during the geotechnical investigation. Therefore, the possibility of significant fault rupture on the site is considered to be low.

The potential for other geologic hazards such as seismically induced settlement, lateral spreading, tsunamis, inundation, seiches, flooding, and subsidence affecting the site is considered low.

2019 CBC Seismic Design Parameters

Based on the standards in place at the time of this report, we expect that the proposed building will be designed in accordance with the 2019 Edition of the California Building Code (CBC), which was adopted on January 1, 2020. The 2019 CBC Seismic Design Parameters have been generated using the SEAOC/OSHPD Seismic Design Maps Tool, a web-based software application available at the website www.seismicmaps.org. This software application calculates seismic design parameters in accordance with several building code reference documents, including ASCE 7-16, upon which the 2019 CBC is based. The application utilizes a database of risk-targeted maximum considered earthquake (MCE_R) site accelerations at 0.01-degree intervals for each of the code

documents. The table below was created using data obtained from the application. The output generated from this program is included as Plate E-1 of this report. Based on this output, the following parameters may be utilized for the subject site:

The 2019 CBC requires that a site-specific ground motion study be performed in accordance with Section 11.4.8 of ASCE 7-16 for Site Class D sites with a mapped S_1 value greater than 0.2. However, Section 11.4.8 of ASCE 7-16 also indicates an exception from the requirement for a site-specific ground motion hazard analysis for certain structures on Site Class D sites. The commentary for Section 11 of ASCE 7-16 (Page 534 of Section C11 of ASCE 7-16) indicates that "In general, this exception effectively limits the requirements for site-specific hazard analysis to very tall and or flexible structures at Site Class D sites." **Based on our understanding of the proposed development, the seismic design parameters presented below were calculated assuming that the exception in Section 11.4.8 applies to the proposed structure at this site. However, the structural engineer should verify that this exception is applicable to the proposed structures.** Based on the exception, the spectral response accelerations presented below were calculated using the site coefficients (F_a and F_v) from Tables 11.4-1 and 11.4-2 presented in Section 11.4.4 of ASCE 7-16.

2019 CBC SEISMIC DESIGN PARAMETERS

Parameter		Value
Mapped MCE_R Acceleration at 0.2 sec Period	S_S	1.803
Mapped MCE_R Acceleration at 1.0 sec Period	S_1	0.634
Site Class	---	D
Site Modified Spectral Acceleration at 0.2 sec Period	S_{MS}	1.803
Site Modified Spectral Acceleration at 1.0 sec Period	S_{M1}	1.078
Design Spectral Acceleration at 0.2 sec Period	S_{DS}	1.202
Design Spectral Acceleration at 1.0 sec Period	S_{D1}	0.719

It should be noted that the site coefficient F_v and the parameters S_{M1} and S_{D1} were not included in the SEAOC/OSHPD Seismic Design Maps Tool output for the ASCE 7-16. We calculated these parameters-based on Table 11.4-2 in Section 11.4.4 of ASCE 7-16 using the value of S_1 obtained from the Seismic Design Maps Tool, assuming that a site-specific ground motion hazards analysis is not required for the proposed buildings at this site.

Liquefaction

Liquefaction is the loss of the strength in generally cohesionless, saturated soils when the pore-water pressure induced in the soil by a seismic event becomes equal to or exceeds the overburden pressure. The primary factors which influence the potential for liquefaction include groundwater table elevation, soil type and grain size characteristics, relative density of the soil, initial confining pressure, and intensity and duration of ground shaking. The depth within which the occurrence of liquefaction may impact surface improvements is generally identified as the upper 50 feet below the existing ground surface. Liquefaction potential is greater in saturated, loose, poorly graded fine sands with a mean (d_{50}) grain size in the range of 0.075 to 0.2 mm (Seed and Idriss,

1971). Clayey (cohesive) soils or soils which possess clay particles (d<0.005mm) in excess of 20 percent (Seed and Idriss, 1982) are generally not considered to be susceptible to liquefaction, nor are those soils which are above the historic static groundwater table.

The Earthquake Zones of Required Investigation, La Habra Quadrangle map, published by the California Geological Survey (CGS), indicates that the subject site is not located within a designated liquefaction hazard zone. In addition, the subsurface conditions encountered at the subject site are not considered to be conducive to liquefaction. Based on the conditions encountered at the boring locations, and the mapping performed by the CGS, liquefaction is not considered to be a significant design concern for this project.

6.2 Preliminary Geotechnical Design Considerations

General

Artificial fill soils and possible fill soils were encountered beneath the pavements or at the ground surface at all of the boring locations, extending to depths of 5½ to 8½± feet below the existing site grades. Previous geotechnical investigations identified fill soils extending to depths of up to 10± feet. These fill soils possess variable densities and variable consolidation/collapse characteristics indicating that they do not represent engineered fill soils. Therefore, most of the fill soils encountered at this site are not considered suitable to support the foundation loads of the new structures. It will be necessary to either remove and replace these soils as engineered fill, or extend foundations for the development through these fill soils into the dense terrace deposits below.

The proposed office building will consist of two sections, both of which will be supported over existing retail buildings. We understand that priority is being given to minimizing the impact that construction of these office buildings will have on the tenants of the existing retail buildings. Based on the column loads that will be supported by the office building foundations, some type of deep foundations will likely be necessary to support the structures while providing minimal disturbance to the existing tenants. Preliminary information concerning deep foundation elements is provided in a subsequent section of this report. It is expected that supplemental subsurface exploration will be required in the area of the proposed office building in order to provide more specific deep foundation design data.

Construction of the proposed improvements will require excavation immediately adjacent to existing buildings, pavements, and possibly retaining walls and other miscellaneous site improvements. It is considered likely that shoring and/or slot cutting will be required for portions of the proposed construction. Detailed shoring design parameters can be developed once a specific foundation plan and grading plan have been developed.

Settlement

Based on the recommendations contained in this report, the foundations for the new development will be supported on newly placed compacted structural fill, or extended through any undocumented fill soils into dense to very dense Terrace deposits. Provided that the recommended remedial grading is completed and adequate foundation embedment is utilized,

the post-construction static settlements of the proposed structures are expected to be within tolerable limits.

Soluble Sulfates

The result of the soluble sulfate testing, as discussed in Section 5.0 of this report, indicates that the concentration of soluble sulfates within the selected samples of the on-site soils correspond to Category S0, with respect to the American Concrete Institute (ACI) Publication 318-05 Building Code Requirements for Structural Concrete and Commentary, Section 4.3. Therefore, specialized concrete mix designs are not considered to be necessary, with regard to sulfate protection purposes. It is, however, recommended that additional soluble sulfate testing be conducted at the time of the design-level geotechnical investigation and at the completion of rough grading to verify the soluble sulfate concentrations of the soils which are present at pad grade within the building areas.

Corrosion Potential

The results of laboratory testing indicate that the tested samples of the on-site soils possesses saturated resistivity values of 1,040 and 1,440 ohm-cm, and pH values of 7.7 and 7.9. These test results have been evaluated in accordance with guidelines published by the Ductile Iron Pipe Research Association (DIPRA). The DIPRA guidelines consist of a point system by which characteristics of the soils are used to quantify the corrosivity characteristics of the site. Resistivity and pH are two of the five factors that enter into the evaluation procedure. Redox potential, relative soil moisture content and sulfides are also included. Although sulfide testing was not part of the scope of services for this project, we have evaluated the corrosivity characteristics of the on-site soils using resistivity, pH and moisture content. **Based on these factors, and utilizing the DIPRA procedure, the on-site soils are considered to be corrosive to ferrous pipes. Therefore, corrosion protection is expected to be required for cast iron or ductile iron pipes.** It should be noted that SCG does not practice in the field of corrosion engineering, and therefore, the client may also wish to contact a corrosion engineer to provide a more thorough evaluation.

Relatively low concentrations (4 and 106 mg/kg) of chlorides were detected in the samples submitted for corrosivity testing. In general, soils possessing chloride concentrations in excess of 500 parts per million (ppm) are considered to be corrosive with respect to steel reinforcement within reinforced concrete. Based on the lack of any significant chlorides in the tested sample, the site is considered to have a C1 chloride exposure in accordance with the American Concrete Institute (ACI) Publication 318 Building Code Requirements for Structural Concrete and Commentary. Therefore, a specialized concrete mix design for reinforced concrete for protection against chloride exposure is not considered warranted. We recommend that additional corrosivity testing be performed at the time of the design-level geotechnical investigation in order to confirm the chloride exposure category.

Expansion

The near-surface soils encountered within the upper 10± feet at this site include interbedded layers of silty sands, sandy clays and silty clays. The result of expansion index testing performed on representative samples of these materials indicate that they possess low to medium expansion potentials (EI = 38 to 55). The preliminary design recommendations contained within this report

are based on the presence of low to medium expansive soils. We recommend that additional expansion index testing be performed at the time of the design-level geotechnical investigation and at the completion of rough grading in order to confirm the expansion potential of the near-surface soils at this site.

Shrinkage/Subsidence

Removal and recompaction of the near-surface fill soils is estimated to result in an average shrinkage of 7 to 12 percent. It should be noted that the potential shrinkage estimate is based on dry density testing performed on small-diameter samples taken at the boring locations. If a more accurate and precise shrinkage estimate is desired, SCG can perform a shrinkage study involving several excavated test-pits where in-place densities are determined using in-situ testing methods instead of laboratory density testing on small-diameter samples. Please contact SCG for details and a cost estimate regarding a shrinkage study, if desired.

Minor ground subsidence is expected to occur in the soils below the zone of removal, due to settlement and machinery working. The subsidence is estimated to be 0.10 feet.

These estimates are based on previous experience and the subsurface conditions encountered at the boring locations. The actual amount of subsidence is expected to be variable and will be dependent on the type of machinery used, repetitions of use, and dynamic effects, all of which are difficult to assess precisely.

Additional Geotechnical Investigation

As discussed above, the focus of the current phase of investigation was to determine the geotechnical feasibility of the proposed development at the subject site. Prior to preparing detailed grading or foundation plans, a site-specific, detailed geotechnical investigation should be performed. The purpose of this supplementary investigation will be to obtain more detailed data regarding the subsurface conditions at the subject site. The scope of this future investigation should be sufficient to provide detailed grading recommendations as well as foundation, floor slab, and pavement design recommendations.

6.3 Preliminary Site Grading Recommendations

The preliminary grading recommendations presented below are based on the design details that were available at the time of this report, and the subsurface conditions encountered at our boring locations. These recommendations are general and preliminary in nature, and should be confirmed as part of the future design-level geotechnical investigation.

Site Stripping and Demolition

Initial site stripping should include removal of all surficial vegetation from slopes or landscaped planters. Any organic topsoil and tree root masses should be removed during site stripping. The actual extent of site stripping should be determined in the field by the geotechnical engineer, based on the organic content and stability of the materials encountered.

The proposed development will require demolition of portions of the existing buildings and pavements. Any existing improvements that will not remain in place for use with the new development should be removed in their entirety. This should include all foundations, floor slabs, utilities, and any other subsurface improvements associated with the existing structures. Debris resultant from demolition should be disposed of off-site. These materials may be crushed and made into miscellaneous base for use in the proposed pavement areas.

Detailed structural information regarding the new buildings has not been provided to our office. Based on preliminary conversations with the project structural engineer, it is expected that the hotel and residential buildings will be supported on conventional shallow foundations. Small-diameter deep foundations may be utilized to support the structural loads of the new office building that will be constructed over the existing retail.

Treatment of Existing Soils: Hotel and Residential Buildings

Based on the borings performed for this study, as well as borings performed at the subject site as part of previous geotechnical investigations, the area of the proposed hotel and residential buildings is underlain by 5 to 10± feet of undocumented fill soils. These materials are underlain by relatively high strength terrace deposits. The most feasible means of supporting the proposed structures is to utilize shallow foundations which extend through the undocumented fill soils into the dense to very dense terrace deposits below. If this method of construction is utilized, no significant remedial grading will be necessary within the foundation areas of the proposed buildings.

Within a given structure, it is recommended that all foundations be supported within the dense terrace deposits, or on a newly placed layer of compacted structural fill, in order to limit differential settlements. Where foundations are supported on new structural fill soils, this layer of fill is typically 3 to 5± feet in thickness, but the precise depth should be determined during the design-level geotechnical investigation.

Any existing undocumented fill soil should also be removed from proposed building slab areas. It is also recommended that the slab areas be underlain by a newly placed layer of structural fill, at least 2 to 3 feet in thickness. The actual depth of overexcavation should be determined during the design-level geotechnical investigation.

Treatment of Existing Soils: Retaining Walls and Site Walls

Although not indicated on the site plan, it may be necessary to construct some small retaining walls or site walls at or near the existing surface grade. Overexcavation will also be necessary in these areas to remove all of the existing fill soils. The overexcavation depth should be expected to be on the order of 3 to 5 feet below proposed foundation bearing grade. Alternatively, the retaining wall foundations could be extended into the dense to very dense terrace deposits.

Treatment of Existing Soils: Parking Areas

Based on economic considerations, overexcavation of the existing soils in the new parking and drive areas is not considered warranted, with the exception of areas where lower strength, or unstable soils are identified by the geotechnical engineer during grading. Subgrade preparation

in the new parking and drive areas should initially consist of removal of all soils disturbed during stripping and demolition operations.

The geotechnical engineer should then evaluate the subgrade to identify any areas of additional unsuitable soils. Any such materials should be removed to a level of firm and unyielding soil. The exposed subgrade soils should then be scarified to a depth of 12± inches, moisture conditioned to at least 2 to 4 percent above optimum, and recompacted to at least 90 percent of the ASTM D-1557 maximum dry density. Based on the presence of variable strength surficial soils throughout the site, it is expected that some isolated areas of additional overexcavation may be required to remove zones of lower strength, unsuitable soils.

The grading recommendations presented above for the proposed parking areas assume that the owner and/or developer can tolerate minor amounts of settlement within the proposed parking areas. The grading recommendations presented above do not completely mitigate the extent of the existing fill soils and low strength alluvium in the parking areas. As such, settlement and associated pavement distress could occur. Typically, repair of such distressed areas involves significantly lower costs than completely mitigating these soils at the time of construction. If the owner cannot tolerate the risk of such settlements, the parking and drive areas may also be overexcavated, with the removed soils replaced as compacted structural fill.

Fill Placement

- Fill soils should be placed in thin (6± inches), near-horizontal lifts, moisture conditioned to 2 to 4 percent above the optimum moisture content, and compacted. Drying of the on-site soils may be required before placement and compaction of structural fill.
- On-site soils may be used for fill provided they are cleaned of any debris to the satisfaction of the geotechnical engineer.
- All grading and fill placement activities should be completed in accordance with the requirements of the 2019 CBC and the grading code of the city of Brea.
- All fill soils should be compacted to at least 90 percent of the ASTM D-1557 maximum dry density. Fill soils should be well mixed.
- Compaction tests should be performed periodically by the geotechnical engineer as random verification of compaction and moisture content. These tests are intended to aid the contractor. Since the tests are taken at discrete locations and depths, they may not be indicative of the entire fill and therefore should not relieve the contractor of his responsibility to meet the job specifications.

Imported Structural Fill

All imported structural fill should consist of low expansive (EI < 40), well graded soils possessing at least 10 percent fines (that portion of the sample passing the No. 200 sieve). Additional specifications for structural fill are presented in the Grading Guide Specifications, included as Appendix D.

Utility Trench Backfill

In general, all utility trench backfill should be compacted to at least 90 percent of the ASTM D-1557 maximum dry density. Compacted trench backfill should conform to the requirements of the local grading code, and more restrictive requirements may be indicated by the city of Brea. All

utility trench backfills should be witnessed by the geotechnical engineer. The trench backfill soils should be compaction tested where possible; probed and visually evaluated elsewhere.

Utility trenches which parallel a footing, and extending below a 1h:1v plane projected from the outside edge of the footing should be backfilled with structural fill soils, compacted to at least 90 percent of the ASTM D-1557 standard. Pea gravel backfill should not be used for these trenches.

6.4 Construction Considerations

Excavation Considerations

The near-surface soils generally consist of a variety of materials, including sands, silts, and clays. Some of these materials may be subject to caving within shallow excavations. Where caving occurs within shallow excavations, flattened excavation slopes may be sufficient to provide excavation stability. On a preliminary basis, temporary excavation slopes consisting of sands and silty sands should be made no steeper than 2h:1v. Temporary excavation slopes consisting of clayey soils should be made no steeper than 1.5h:1v.

The contractor should take all necessary precautions during grading and foundation construction to prevent damage to structures and improvements which are adjacent to the proposed development. Deeper excavations may require some form of external stabilization such as shoring or bracing. Maintaining adequate moisture content within the near-surface soils will improve excavation stability. All excavation activities on this site should be conducted in accordance with Cal-OSHA regulations.

Moisture Sensitive Subgrade Soils

The near-surface soils generally consist of moist to very moist sands, sandy clays, and silty clays, and will become unstable if exposed to significant moisture infiltration or disturbance by construction traffic. If grading occurs during a period of relatively wet weather, an increase in subgrade instability should also be expected. The site should, therefore, be graded to prevent ponding of surface water and to prevent water from running into excavations.

If the construction schedule dictates that site grading will occur during a period of wet weather, allowances should be made for costs and delays associated with drying the on-site soils or import of a drier, less moisture sensitive fill material. Grading during wet or cool weather may also increase the depth of overexcavation in the pad area as well as the need for and/or the thickness of a crushed stone stabilization layer.

Expansive Soils

The near surface on-site soils have been determined to possess a low to medium expansion potential. Therefore, care should be given to proper moisture conditioning of all building pad subgrade soils to a moisture content of 2 to 4 percent above the Modified Proctor optimum during site grading. All imported fill soils should have very low expansive (EI < 20) characteristics. **In addition to adequately moisture conditioning the subgrade soils and fill soils during grading, special care must be taken to maintain moisture content of these soils at 2**

to 4 percent above the Modified Proctor optimum. This will require the contractor to frequently moisture condition these soils throughout the grading process, unless grading occurs during a period of relatively wet weather.

Due to the presence of expansive soils at this site, provisions should be made to limit the potential for surface water to penetrate the soils immediately adjacent to the structures. These provisions should include directing surface runoff into rain gutters and area drains, reducing the extent of landscaped areas around the structure, and sloping the ground surface away from the buildings. Where possible, it is recommended that landscaped planters not be located immediately adjacent to the building. If landscaped planters around the building are necessary, it is recommended that drought tolerant plants or a drip irrigation system be utilized, to minimize the potential for deep moisture penetration around the structure. Presented below is a list of additional soil moisture control recommendations that should be considered by the owner, developer, and civil engineer:

- Ponding and areas of low flow gradients in unpaved walkways, grass and planter areas should be avoided. In general, minimum drainage gradients of 2 percent should be maintained in unpaved areas.
- Bare soil within five feet of proposed structures should be sloped at a minimum 2 percent gradient away from the structure (about three inches of fall in five feet), or the same area could be paved with a minimum surface gradient of one percent. Pavement is preferable.
- Decorative gravel ground cover tends to provide a reservoir for surface water and may hide areas of ponding or poor drainage. Decorative gravel is, therefore, not recommended and should not be utilized for landscaping unless equipped with a subsurface drainage system designed by a licensed landscape architect.
- Positive drainage devices, such as graded swales, paved ditches, and catch basins should be installed at appropriate locations within the area of the proposed development.
- Concrete walks and flatwork should not obstruct the free flow of surface water to the appropriate drainage devices.
- Area drains should be recessed below grade to allow free flow of water into the drain. Concrete or brick flatwork joints should be sealed with mortar or flexible mastic.
- Gutter and downspout systems should be installed to capture all discharge from roof areas. Downspouts should discharge directly into a pipe or paved surface system to be conveyed offsite.
- Enclosed planters adjoining, or in close proximity to proposed structures, should be sealed at the bottom and provided with subsurface collection systems and outlet pipes.
- Depressed planters should be raised with soil to promote runoff (minimum drainage gradient two percent or five percent, see above), and/or equipped with area drains to eliminate ponding.
- Drainage outfall locations should be selected to avoid erosion of slopes and/or properly armored to prevent erosion of graded surfaces. No drainage should be directed over or towards adjoining slopes.
- All drainage devices should be maintained on a regular basis, including frequent observations during the rainy season to keep the drains free of leaves, soil and other debris.
- Landscape irrigation should conform to the recommendations of the landscape architect and should be performed judiciously to preclude either soaking or excessive drying of the foundation soils. This should entail regular watering during the drier portions of the year and little or no irrigation during the rainy season. Automatic sprinkler systems should, therefore, be switched to manual operation during the rainy season. Good irrigation practice typically requires frequent application of limited quantities of water that are sufficient to sustain plant growth, but do not excessively wet the soils. Ponding and/or run-off of irrigation water are indications of excessive watering.

Other provisions, as determined by the landscape architect or civil engineer, may also be appropriate.

Groundwater

The static groundwater table at this site is considered to exist at a depth of 22 to 23± feet. Therefore, groundwater is not expected to impact the grading or shallow foundation construction activities. Deep foundations, such as cast-in-drilled-hole (CIDH) piles or piers extending to depths of 20 feet or more will likely encounter groundwater, and groundwater control should be considered in the design and construction planning.

6.5 Preliminary Shallow Foundation Design Recommendations

Based on the preceding geotechnical design considerations and preliminary grading recommendations, it is assumed that the new building foundations will be underlain by existing dense to very dense terrace deposits, or newly placed structural fill soils, extending to depths of at least 3 to 5 feet below foundation bearing grades. Based on this subsurface profile, the proposed structures may be supported on conventional shallow foundations.

The foundation design parameters presented below provide anticipated ranges for the allowable soil bearing pressures. These ranges should be refined during the subsequent design-level geotechnical investigation.

Building Foundation Design Parameters

New square and rectangular footings may be designed as follows:

- Maximum, net allowable soil bearing pressure for footings supported on dense to very dense native terrace deposits: 4,000 to 5,000 lbs/ft^2.
- Maximum, net allowable soil bearing pressure for footings supported on newly-placed engineered fill soils: 2,500 to 3,000 lbs/ft^2.
- Minimum longitudinal steel reinforcement within strip footings: Four (4) No. 5 rebars (2 top and 2 bottom) due to the expansion potential of the on-site soils.
- The actual design of the foundations should be determined by the structural engineer.

General Foundation Design Recommendations

The allowable bearing pressures presented above may be increased by one-third when considering short duration wind or seismic loads. Additional reinforcement may be necessary for structural considerations. The actual design of the foundations should be determined by the structural engineer.

Estimated Foundation Settlements

Typically, foundations designed in accordance with the preliminary foundation design parameters presented above will experience total and differential settlements of less than 1.5 and 0.75 inches, respectively. A detailed settlement analysis should be conducted as part of the design-level geotechnical investigation, once detailed foundation loading information is available.

Lateral Load Resistance

Lateral load resistance will be developed by a combination of friction acting at the base of foundations and slabs and the passive earth pressure developed by footings below grade. The following friction and passive pressure may be used to resist lateral forces:

- Passive Earth Pressure: 225 to 275 lbs/ft^3
- Friction Coefficient: 0.25 to 0.30

6.6 Preliminary Deep Foundation Design Recommendations

Deep foundations may be the desirable method of support for the proposed office building, in order to minimize the impact to the tenants of the existing retail that will remain in place below the new office building. Typically, these deep foundations would consist of cast-in-drilled-hole (CIDH) piles. Based on the subsurface conditions encountered at this site, these piles would need to extend to depths of at least 15 to 20± feet. On a preliminary basis, CIDH piles extending to a depth of 20± feet would have the following approximate vertical capacities:

- 18-inch CIDH piles: 40 to 80 kips
- 24-inch CIDH piles: 55 to 110 kips
- 18-inch CIDH piles: 80 to 160 kips

Other types of specialty piles may also be feasible for this site, including pneumatically driven micro-piles or helical piles. These systems are typically designed and installed by a specialty contractor. We can provide geotechnical design parameters to such a contractor at the client's request.

6.7 Preliminary Floor Slab Design and Construction Recommendations

Subgrades which will support new floor slabs should be prepared in accordance with the recommendations contained in the ***Site Grading Recommendations*** section of this report. Preliminarily, the floors of the proposed structures may be constructed as conventional slabs-on-grade supported on newly placed structural fill. Based on geotechnical considerations, the floor slabs may be designed as follows:

- Minimum slab thickness: 5 to 6 inches.

- Steel reinforcement is expected to be necessary, based on the expansive potential of the soils underlying the subject site. Typically, No. 3 or No. 4 bars at 16 to 18 inches on center is adequate.

- Slab underlayment: If moisture sensitive floor coverings will be used then minimum slab underlayment should consist of a moisture vapor barrier constructed below the entire area of the proposed slab which will incorporate such coverings. The moisture vapor barrier should meet or exceed the Class A rating as defined by ASTM E 1745-97 and have a permeance rating less than 0.01 perms as described in ASTM E 96-95 and ASTM E 154-88. A polyolefin material such as Stego® Wrap Vapor Barrier or equivalent will meet these

specifications. The moisture vapor barrier should be properly constructed in accordance with all applicable manufacturer specifications. Given that a rock free subgrade is anticipated and that a capillary break is not required, sand below the barrier is not required. The need for sand and/or the amount of sand above the moisture vapor barrier should be specified by the structural engineer or concrete contractor. The selection of sand above the barrier is not a geotechnical engineering issue and hence outside our purview. Where moisture sensitive floor coverings are not anticipated, the vapor barrier may be eliminated.

- Moisture condition the floor slab subgrade soils to 2 to 4 percent above the Modified Proctor optimum moisture content, to a depth of 12 inches. The moisture content of the floor slab subgrade soils should be verified by the geotechnical engineer within 24 hours prior to concrete placement.

- Proper concrete curing techniques should be utilized to reduce the potential for slab curling or the formation of excessive shrinkage cracks.

The actual design of the floor slab should be completed by the structural engineer to verify adequate thickness and reinforcement. The recommendations presented above should be confirmed during the design level geotechnical investigation.

6.8 Preliminary Retaining Wall Design and Construction

Although not indicated on the site plan, some small (less than 6 feet in height) retaining walls may be required to facilitate the new site grades. The parameters recommended for use in the design of these walls are presented below.

Retaining Wall Design Parameters

Based on the soil conditions encountered at the boring locations, the following parameters may be used for preliminary design of new retaining walls for this site. **Most of the on-site soils consist of potentially expansive silty and sandy clays. These materials are not considered suitable for use as retaining wall backfill**. Therefore, we have provided parameters assuming the use of imported very low expansive soils for retaining wall backfill. These imported soils should consist of well graded sands or silty sands, possessing an internal angle of friction of at least 30 degrees when compacted to 90 percent relative compaction.

If desired, SCG could provide design parameters for an alternative select backfill material behind the retaining walls. The use of select backfill material could result in lower lateral earth pressures. In order to use the design parameters for the imported select fill, this material must be placed within the entire active failure wedge. This wedge is defined as extending from the heel of the retaining wall upwards at an angle of approximately 60° from horizontal. If select backfill material behind the retaining wall is desired, SCG should be contacted for supplementary recommendations.

RETAINING WALL DESIGN PARAMETERS

Design Parameter		Soil Type
		Imported Sands and Silty Sands
Internal Friction Angle (ϕ)		30°
Unit Weight		130 lbs/ft^3
Equivalent Fluid Pressure:	Active Condition (level backfill)	43 lbs/ft^3
	Active Condition (2h:1v backfill)	70 lbs/ft^3
	At-Rest Condition (level backfill)	65 lbs/ft^3

The walls should be designed using a soil-footing coefficient of friction of 0.25 and an equivalent passive pressure of 250 lbs/ft^3. The structural engineer should incorporate appropriate factors of safety in the design of the retaining walls.

The active earth pressure may be used for the design of retaining walls that do not directly support structures or support soils that in turn support structures and which will be allowed to deflect. The at-rest earth pressure should be used for walls that will not be allowed to deflect such as those which will support foundation bearing soils, or which will support foundation loads directly.

Where the soils on the toe side of the retaining wall are not covered by a "hard" surface such as a structure or pavement, the upper 1 foot of soil should be neglected when calculating passive resistance due to the potential for the material to become disturbed or degraded during the life of the structure.

Seismic Lateral Earth Pressures

In addition to the lateral earth pressures presented in the previous section, retaining walls which are more than 6 feet in height should be designed for a seismic lateral earth pressure, in accordance with the 2019 CBC. Based on the current site plan, it is not expected that any walls in excess of 6 feet in height will be required for this project. If any such walls are proposed, our office should be contacted for supplementary design recommendations.

Retaining Wall Foundation Design

Foundations to support new retaining walls should be designed in accordance with the general Foundation Design Parameters presented in a previous section of this report.

Backfill Material

The on-site soils are not considered suitable for use as retaining wall backfill. All retaining wall backfill soils should consist of imported very low expansive sands or silty sands. All backfill material placed within 3 feet of the back wall face should have a particle size no greater than 3 inches. The retaining wall backfill materials should be well graded.

It is recommended that a minimum 1 foot thick layer of free-draining granular material (less than 5 percent passing the No. 200 sieve) be placed against the face of the retaining walls. This material should extend from the top of the retaining wall footing to within 1 foot of the ground surface on the back side of the retaining wall. This material should be approved by the geotechnical engineer. In lieu of the 1 foot thick layer of free-draining material, a properly installed prefabricated drainage composite such as the MiraDRAIN 6000XL (or approved equivalent), which is specifically designed for use behind retaining walls, may be used. If the layer of free-draining material is not covered by an impermeable surface, such as a structure or pavement, a 12-inch thick layer of a low permeability soil should be placed over the backfill to reduce surface water migration to the underlying soils. The layer of free draining granular material should be separated from the backfill soils by a suitable geotextile, approved by the geotechnical engineer.

All retaining wall backfill should be placed and compacted under engineering controlled conditions in the necessary layer thicknesses to ensure an in-place density between 90 and 93 percent of the maximum dry density as determined by the Modified Proctor test (ASTM D1557). Care should be taken to avoid over-compaction of the soils behind the retaining walls, and the use of heavy compaction equipment should be avoided.

Subsurface Drainage

As previously indicated, the retaining wall design parameters are based upon drained backfill conditions. Consequently, some form of permanent drainage system will be necessary in conjunction with the appropriate backfill material. Subsurface drainage may consist of either:

- A weep hole drainage system typically consisting of a series of 4-inch diameter holes in the wall situated slightly above the ground surface elevation on the exposed side of the wall and at an approximate 8-foot on-center spacing. The weep holes should include a 2 cubic foot pocket of open graded gravel, surrounded by an approved geotextile fabric, at each weep hole location.

- A 4-inch diameter perforated pipe surrounded by 2 cubic feet of gravel per linear foot of drain placed behind the wall, above the retaining wall footing. The gravel layer should be wrapped in a suitable geotextile fabric to reduce the potential for migration of fines. The footing drain should be extended to daylight or tied into a storm drainage system.

6.9 Preliminary Pavement Design Parameters Recommendations

Presented below are preliminary recommendations for the proposed pavements at the subject site. Grading recommendations for these pavement areas should be developed during the design-level geotechnical investigation.

Pavement Subgrades

It is anticipated that the new pavements will be supported on the existing fill soils that have been scarified, moisture conditioned, and recompacted. These materials generally consist of sandy clays and silty clays, as well as occasional zones of sands and silty sands. These materials are

expected to exhibit poor to fair pavement support characteristics, with estimated R-values of 10 to 25. R-value testing performed by SCG as part of a previous study at Brea Plaza indicated an R-value of 13. The subsequent pavement designs are based upon a conservatively assumed R-value of 10. Any fill material imported to the site should have support characteristics equal to or greater than that of the on-site soils and be placed and compacted under engineering controlled conditions. It may be desirable to perform R-value testing after the completion of rough grading to verify the R-value of the as-graded pavement subgrade.

It is recommended that R-value testing be performed during the design-level geotechnical investigation or after completion of rough grading. Depending upon the results of the R-value testing, it may be feasible to use thinner pavement sections in some areas of the site.

Asphaltic Concrete

Presented below are the recommended thicknesses for new flexible pavement structures consisting of asphaltic concrete over a granular base. The pavement designs are based on the traffic indices (TI's) indicated. The client and/or civil engineer should verify that these TI's are representative of the anticipated traffic volumes. If the client and/or civil engineer determine that the expected traffic volume will exceed the applicable traffic index, we should be contacted for supplementary recommendations. The design traffic indices equate to the following approximate daily traffic volumes over a 20-year design life, assuming six operational traffic days per week.

Traffic Index	No. of Heavy Trucks per Day
4.0	0
5.0	1
6.0	3
7.0	11

For the purpose of the traffic volumes indicated above, a truck is defined as a 5-axle tractor trailer unit with one 8-kip axle and two 32-kip tandem axles. All of the traffic indices allow for 1,000 automobiles per day.

ASPHALT PAVEMENTS (R = 10)				
Materials	Thickness (inches)			
	Auto Parking (TI = 4.0)	Auto Drive Lanes (TI = 5.0)	Truck Traffic	
			(TI = 6.0)	(TI = 7.0)
Asphalt Concrete	3	3	3½	4
Aggregate Base	6	9	11	15
Compacted Subgrade	12	12	12	12

The aggregate base course should be compacted to at least 95 percent of the ASTM D-1557 maximum dry density. The asphaltic concrete should be compacted to at least 95 percent of the batch plant-reported maximum density. The aggregate base course may consist of crushed aggregate base (CAB) or crushed miscellaneous base (CMB), which is a recycled gravel, asphalt

and concrete material. The gradation, R-Value, Sand Equivalent, and Percentage Wear of the CAB or CMB should comply with appropriate specifications contained in the current edition of the "Greenbook" Standard Specifications for Public Works Construction.

Portland Cement Concrete

The preparation of the subgrade soils within concrete pavement areas should be performed as previously described for proposed asphalt pavement areas. The minimum recommended thicknesses for the Portland Cement Concrete pavement sections are as follows:

PORTLAND CEMENT CONCRETE PAVEMENTS (R = 10)			
Materials	**Thickness (inches)**		
	Auto Parking & Drives (TI = 5.0)	Truck Traffic	
		(TI = 6.0)	(TI = 7.0)
PCC	5	5½	6
Compacted Subgrade (95% Relative Compaction)	12	12	12

The concrete should have a 28-day compressive strength of at least 3,000 psi. Reinforcing within all pavements should be designed by the structural engineer. The maximum joint spacing within all of the PCC pavements is recommended to be equal to or less than 30 times the pavement thickness. The actual joint spacing and reinforcing of the Portland cement concrete pavements should be determined by the structural engineer.

7.0 GENERAL COMMENTS

This report has been prepared as an instrument of service for use by the client, in order to aid in the evaluation of this property and to assist the architects and engineers in the design and preparation of the project plans and specifications. This report may be provided to the contractor(s) and other design consultants to disclose information relative to the project. However, this report is not intended to be utilized as a specification in and of itself, without appropriate interpretation by the project architect, civil engineer, and/or structural engineer. The reproduction and distribution of this report must be authorized by the client and Southern California Geotechnical, Inc. Furthermore, any reliance on this report by an unauthorized third party is at such party's sole risk, and we accept no responsibility for damage or loss which may occur. The client(s)' reliance upon this report is subject to the Engineering Services Agreement, incorporated into our proposal for this project.

The analysis of this site was based on a subsurface profile interpolated from limited discrete soil samples. While the materials encountered in the project area are considered to be representative of the total area, some variations should be expected between boring locations and sample depths. If the conditions encountered during construction vary significantly from those detailed herein, we should be contacted immediately to determine if the conditions alter the recommendations contained herein.

This report has been based on assumed or provided characteristics of the proposed development. It is recommended that the owner, client, architect, structural engineer, and civil engineer carefully review these assumptions to ensure that they are consistent with the characteristics of the proposed development. If discrepancies exist, they should be brought to our attention to verify that they do not affect the conclusions and recommendations contained herein. We also recommend that the project plans and specifications be submitted to our office for review to verify that our recommendations have been correctly interpreted.

The analysis, conclusions, and recommendations contained within this report have been promulgated in accordance with generally accepted professional geotechnical engineering practice. No other warranty is implied or expressed.

APPENDIX B

BORING LOG LEGEND

SAMPLE TYPE	GRAPHICAL SYMBOL	SAMPLE DESCRIPTION
AUGER		SAMPLE COLLECTED FROM AUGER CUTTINGS, NO FIELD MEASUREMENT OF SOIL STRENGTH. (DISTURBED)
CORE		ROCK CORE SAMPLE: TYPICALLY TAKEN WITH A DIAMOND-TIPPED CORE BARREL. TYPICALLY USED ONLY IN HIGHLY CONSOLIDATED BEDROCK.
GRAB		SOIL SAMPLE TAKEN WITH NO SPECIALIZED EQUIPMENT, SUCH AS FROM A STOCKPILE OR THE GROUND SURFACE. (DISTURBED)
CS		CALIFORNIA SAMPLER: 2-1/2 INCH I.D. SPLIT BARREL SAMPLER, LINED WITH 1-INCH HIGH BRASS RINGS. DRIVEN WITH SPT HAMMER. (RELATIVELY UNDISTURBED)
NSR		NO RECOVERY: THE SAMPLING ATTEMPT DID NOT RESULT IN RECOVERY OF ANY SIGNIFICANT SOIL OR ROCK MATERIAL.
SPT		STANDARD PENETRATION TEST: SAMPLER IS A 1.4 INCH INSIDE DIAMETER SPLIT BARREL, DRIVEN 18 INCHES WITH THE SPT HAMMER. (DISTURBED)
SH		SHELBY TUBE: TAKEN WITH A THIN WALL SAMPLE TUBE, PUSHED INTO THE SOIL AND THEN EXTRACTED. (UNDISTURBED)
VANE		VANE SHEAR TEST: SOIL STRENGTH OBTAINED USING A 4 BLADED SHEAR DEVICE. TYPICALLY USED IN SOFT CLAYS-NO SAMPLE RECOVERED.

COLUMN DESCRIPTIONS

DEPTH: Distance in feet below the ground surface.

SAMPLE: Sample Type as depicted above.

BLOW COUNT: Number of blows required to advance the sampler 12 inches using a 140 lb hammer with a 30-inch drop. 50/3" indicates penetration refusal (>50 blows) at 3 inches. WH indicates that the weight of the hammer was sufficient to push the sampler 6 inches or more.

POCKET PEN.: Approximate shear strength of a cohesive soil sample as measured by pocket penetrometer.

GRAPHIC LOG: Graphic Soil Symbol as depicted on the following page.

DRY DENSITY: Dry density of an undisturbed or relatively undisturbed sample in lbs/ft^3.

MOISTURE CONTENT: Moisture content of a soil sample, expressed as a percentage of the dry weight.

LIQUID LIMIT: The moisture content above which a soil behaves as a liquid.

PLASTIC LIMIT: The moisture content above which a soil behaves as a plastic.

PASSING #200 SIEVE: The percentage of the sample finer than the #200 standard sieve.

UNCONFINED SHEAR: The shear strength of a cohesive soil sample, as measured in the unconfined state.

APPENDIX D

GRADING GUIDE SPECIFICATIONS

These grading guide specifications are intended to provide typical procedures for grading operations. They are intended to supplement the recommendations contained in the geotechnical investigation report for this project. Should the recommendations in the geotechnical investigation report conflict with the grading guide specifications, the more site specific recommendations in the geotechnical investigation report will govern.

General

- The Earthwork Contractor is responsible for the satisfactory completion of all earthwork in accordance with the plans and geotechnical reports, and in accordance with city, county, and applicable building codes.

- The Geotechnical Engineer is the representative of the Owner/Builder for the purpose of implementing the report recommendations and guidelines. These duties are not intended to relieve the Earthwork Contractor of any responsibility to perform in a workman-like manner, nor is the Geotechnical Engineer to direct the grading equipment or personnel employed by the Contractor.

- The Earthwork Contractor is required to notify the Geotechnical Engineer of the anticipated work and schedule so that testing and inspections can be provided. If necessary, work may be stopped and redone if personnel have not been scheduled in advance.

- The Earthwork Contractor is required to have suitable and sufficient equipment on the job-site to process, moisture condition, mix and compact the amount of fill being placed to the approved compaction. In addition, suitable support equipment should be available to conform with recommendations and guidelines in this report.

- Canyon cleanouts, overexcavation areas, processed ground to receive fill, key excavations, subdrains and benches should be observed by the Geotechnical Engineer prior to placement of any fill. It is the Earthwork Contractor's responsibility to notify the Geotechnical Engineer of areas that are ready for inspection.

- Excavation, filling, and subgrade preparation should be performed in a manner and sequence that will provide drainage at all times and proper control of erosion. Precipitation, springs, and seepage water encountered shall be pumped or drained to provide a suitable working surface. The Geotechnical Engineer must be informed of springs or water seepage encountered during grading or foundation construction for possible revision to the recommended construction procedures and/or installation of subdrains.

Site Preparation

- The Earthwork Contractor is responsible for all clearing, grubbing, stripping and site preparation for the project in accordance with the recommendations of the Geotechnical Engineer.

- If any materials or areas are encountered by the Earthwork Contractor which are suspected of having toxic or environmentally sensitive contamination, the Geotechnical Engineer and Owner/Builder should be notified immediately.

- Major vegetation should be stripped and disposed of off-site. This includes trees, brush, heavy grasses and any materials considered unsuitable by the Geotechnical Engineer.

- Underground structures such as basements, cesspools or septic disposal systems, mining shafts, tunnels, wells and pipelines should be removed under the inspection of the Geotechnical Engineer and recommendations provided by the Geotechnical Engineer and/or city, county or state agencies. If such structures are known or found, the Geotechnical Engineer should be notified as soon as possible so that recommendations can be formulated.

- Any topsoil, slopewash, colluvium, alluvium and rock materials which are considered unsuitable by the Geotechnical Engineer should be removed prior to fill placement.

- Remaining voids created during site clearing caused by removal of trees, foundations basements, irrigation facilities, etc., should be excavated and filled with compacted fill.

- Subsequent to clearing and removals, areas to receive fill should be scarified to a depth of 10 to 12 inches, moisture conditioned and compacted

- The moisture condition of the processed ground should be at or slightly above the optimum moisture content as determined by the Geotechnical Engineer. Depending upon field conditions, this may require air drying or watering together with mixing and/or discing.

Compacted Fills

- Soil materials imported to or excavated on the property may be utilized in the fill, provided each material has been determined to be suitable in the opinion of the Geotechnical Engineer. Unless otherwise approved by the Geotechnical Engineer, all fill materials shall be free of deleterious, organic, or frozen matter, shall contain no chemicals that may result in the material being classified as "contaminated," and shall be very low to non-expansive with a maximum expansion index (EI) of 50. The top 12 inches of the compacted fill should have a maximum particle size of 3 inches, and all underlying compacted fill material a maximum 6-inch particle size, except as noted below.

- All soils should be evaluated and tested by the Geotechnical Engineer. Materials with high expansion potential, low strength, poor gradation or containing organic materials may require removal from the site or selective placement and/or mixing to the satisfaction of the Geotechnical Engineer.

- Rock fragments or rocks less than 6 inches in their largest dimensions, or as otherwise determined by the Geotechnical Engineer, may be used in compacted fill, provided the distribution and placement is satisfactory in the opinion of the Geotechnical Engineer.

- Rock fragments or rocks greater than 12 inches should be taken off-site or placed in accordance with recommendations and in areas designated as suitable by the Geotechnical Engineer. These materials should be placed in accordance with Plate D-8 of these Grading Guide Specifications and in accordance with the following recommendations:

    - Rocks 12 inches or more in diameter should be placed in rows at least 15 feet apart, 15 feet from the edge of the fill, and 10 feet or more below subgrade. Spaces should be left between each rock fragment to provide for placement and compaction of soil around the fragments.

    - Fill materials consisting of soil meeting the minimum moisture content requirements and free of oversize material should be placed between and over the rows of rock or

concrete. Ample water and compactive effort should be applied to the fill materials as they are placed in order that all of the voids between each of the fragments are filled and compacted to the specified density.

- Subsequent rows of rocks should be placed such that they are not directly above a row placed in the previous lift of fill. A minimum 5-foot offset between rows is recommended.

- To facilitate future trenching, oversized material should not be placed within the range of foundation excavations, future utilities or other underground construction unless specifically approved by the soil engineer and the developer/owner representative.

- Fill materials approved by the Geotechnical Engineer should be placed in areas previously prepared to receive fill and in evenly placed, near horizontal layers at about 6 to 8 inches in loose thickness, or as otherwise determined by the Geotechnical Engineer for the project.

- Each layer should be moisture conditioned to optimum moisture content, or slightly above, as directed by the Geotechnical Engineer. After proper mixing and/or drying, to evenly distribute the moisture, the layers should be compacted to at least 90 percent of the maximum dry density in compliance with ASTM D-1557-78 unless otherwise indicated.

- Density and moisture content testing should be performed by the Geotechnical Engineer at random intervals and locations as determined by the Geotechnical Engineer. These tests are intended as an aid to the Earthwork Contractor, so he can evaluate his workmanship, equipment effectiveness and site conditions. The Earthwork Contractor is responsible for compaction as required by the Geotechnical Report(s) and governmental agencies.

- Fill areas unused for a period of time may require moisture conditioning, processing and recompaction prior to the start of additional filling. The Earthwork Contractor should notify the Geotechnical Engineer of his intent so that an evaluation can be made.

- Fill placed on ground sloping at a 5-to-1 inclination (horizontal-to-vertical) or steeper should be benched into bedrock or other suitable materials, as directed by the Geotechnical Engineer. Typical details of benching are illustrated on Plates D-2, D-4, and D-5.

- Cut/fill transition lots should have the cut portion overexcavated to a depth of at least 3 feet and rebuilt with fill (see Plate D-1), as determined by the Geotechnical Engineer.

- All cut lots should be inspected by the Geotechnical Engineer for fracturing and other bedrock conditions. If necessary, the pads should be overexcavated to a depth of 3 feet and rebuilt with a uniform, more cohesive soil type to impede moisture penetration.

- Cut portions of pad areas above buttresses or stabilizations should be overexcavated to a depth of 3 feet and rebuilt with uniform, more cohesive compacted fill to impede moisture penetration.

- Non-structural fill adjacent to structural fill should typically be placed in unison to provide lateral support. Backfill along walls must be placed and compacted with care to ensure that excessive unbalanced lateral pressures do not develop. The type of fill material placed adjacent to below grade walls must be properly tested and approved by the Geotechnical Engineer with consideration of the lateral earth pressure used in the design.

Foundations

- The foundation influence zone is defined as extending one foot horizontally from the outside edge of a footing, and proceeding downward at a ½ horizontal to 1 vertical (0.5:1) inclination.

- Where overexcavation beneath a footing subgrade is necessary, it should be conducted so as to encompass the entire foundation influence zone, as described above.

- Compacted fill adjacent to exterior footings should extend at least 12 inches above foundation bearing grade. Compacted fill within the interior of structures should extend to the floor subgrade elevation.

Fill Slopes

- The placement and compaction of fill described above applies to all fill slopes. Slope compaction should be accomplished by overfilling the slope, adequately compacting the fill in even layers, including the overfilled zone and cutting the slope back to expose the compacted core

- Slope compaction may also be achieved by backrolling the slope adequately every 2 to 4 vertical feet during the filling process as well as requiring the earth moving and compaction equipment to work close to the top of the slope. Upon completion of slope construction, the slope face should be compacted with a sheepsfoot connected to a sideboom and then grid rolled. This method of slope compaction should only be used if approved by the Geotechnical Engineer.

- Sandy soils lacking in adequate cohesion may be unstable for a finished slope condition and therefore should not be placed within 15 horizontal feet of the slope face.

- All fill slopes should be keyed into bedrock or other suitable material. Fill keys should be at least 15 feet wide and inclined at 2 percent into the slope. For slopes higher than 30 feet, the fill key width should be equal to one-half the height of the slope (see Plate D-5).

- All fill keys should be cleared of loose slough material prior to geotechnical inspection and should be approved by the Geotechnical Engineer and governmental agencies prior to filling.

- The cut portion of fill over cut slopes should be made first and inspected by the Geotechnical Engineer for possible stabilization requirements. The fill portion should be adequately keyed through all surficial soils and into bedrock or suitable material. Soils should be removed from the transition zone between the cut and fill portions (see Plate D-2).

Cut Slopes

- All cut slopes should be inspected by the Geotechnical Engineer to determine the need for stabilization. The Earthwork Contractor should notify the Geotechnical Engineer when slope cutting is in progress at intervals of 10 vertical feet. Failure to notify may result in a delay in recommendations.

- Cut slopes exposing loose, cohesionless sands should be reported to the Geotechnical Engineer for possible stabilization recommendations.

- All stabilization excavations should be cleared of loose slough material prior to geotechnical inspection. Stakes should be provided by the Civil Engineer to verify the location and dimensions of the key. A typical stabilization fill detail is shown on Plate D-5.

- Stabilization key excavations should be provided with subdrains. Typical subdrain details are shown on Plates D-6.

Subdrains

- Subdrains may be required in canyons and swales where fill placement is proposed. Typical subdrain details for canyons are shown on Plate D-3. Subdrains should be installed after approval of removals and before filling, as determined by the Soils Engineer.

- Plastic pipe may be used for subdrains provided it is Schedule 40 or SDR 35 or equivalent. Pipe should be protected against breakage, typically by placement in a square-cut (backhoe) trench or as recommended by the manufacturer.

- Filter material for subdrains should conform to CALTRANS Specification 68-1.025 or as approved by the Geotechnical Engineer for the specific site conditions. Clean ¾-inch crushed rock may be used provided it is wrapped in an acceptable filter cloth and approved by the Geotechnical Engineer. Pipe diameters should be 6 inches for runs up to 500 feet and 8 inches for the downstream continuations of longer runs. Four-inch diameter pipe may be used in buttress and stabilization fills.

SOUTHERN CALIFORNIA GEOTECHNICAL, INC.'S RESULTS OF INFILTRATION TESTING, PROPOSED BREA PLAZA MIXED USE DEVELOPMENT, NWC IMPERIAL HIGHWAY AT ASSOCIATED ROAD, BREA, CALIFORNIA, DATED JULY 30, 2020

July 30, 2020

BOSC Realty Advisors
888 W. Big Beaver Road, Suite 200
Troy, Michigan 48084

Attention: Mr. Waad J. Nadhir

Project No.: **20G168-2**

Subject: **Results of Infiltration Testing**
Proposed Brea Plaza Mixed Use Development
NWC Imperial Highway at Associated Road
Brea, California

Reference: Geotechnical Feasibility Study, Proposed Brea Plaza Mixed Use Development, NWC Imperial Highway at Associated Road, Brea, California, prepared by Southern California Geotechnical, SCG Project No. 20G168-1, dated July 30, 2020.

Mr. Nadhir:

In accordance with your request, we have conducted infiltration testing at the subject site. We are pleased to present this report summarizing the results of the infiltration testing and our design recommendations.

Scope of Services

The scope of services performed for this project was in general accordance with Proposal No. 20P269, dated June 29, 2020. The scope of services included visual site reconnaissance, subsurface exploration, field and laboratory testing, and engineering analysis to determine the infiltration rates of the onsite soils. The infiltration testing was performed in general accordance with the guidelines published by Orange County: Technical Guidance Document for the Preparation of Conceptual/Preliminary and/or Project Water Quality Management Plans (WQMPs), Appendix VII. These guidelines are dated December 20, 2013.

Site and Project Description

Brea Plaza Center is located at the northwest corner of Imperial Highway and Associated Road, in Brea, California. The overall site is bounded to the north by existing single-family residences, to the west by the 57 freeway, to the south by Imperial Highway, and to the east by Associated Road. The general location of the site is illustrated on the Site Location Map, enclosed as Plate 1 in Appendix A of this report.

Brea Plaza is a retail shopping center, approximately 15 acres in size. The specific subject site is a roughly L-shaped area, 2.7± acres in size, located in the western region of Brea Plaza, adjacent to the 57 Freeway. The subject site is presently developed with a Buca de Beppo restaurant, a Custom Comfort Mattress store, a movie theater, and a multi-tenant retail building. The remainder of the subject site is covered by asphaltic concrete (AC) pavements

that are used for automobile and truck parking and drive lanes. Limited areas of the subject site are paved with Portland cement concrete (PCC) pavements. Concrete flatwork and landscaped planters are located throughout the existing development. The remaining areas of the Brea Plaza Center are developed with similar retail and restaurant buildings and AC pavements.

Topographic information for the site was obtained from a site plan provided by Architects Orange. The site topography slopes from the northwest corner towards the southeast. The elevation at the subject site generally ranges from 336± feet mean sea level (msl) in the northern region of the subject site to 329± feet msl in the southern region.

Proposed Development

A preliminary site plan was provided to our office by the client. The site will be developed with several new structures including a hotel, residential apartments, a restaurant, a self-storage building and an office building. The hotel will be located in the southwestern region of the site, will have a footprint of 15,000 to 20,000± ft² and will be 6 stories in height. The restaurant will be incorporated into the first story of the hotel. The apartment building will be located in the northern region of the site, and will have a footprint of 45,000± ft². This building will be a total of 7 stories in height, with the lower two levels consisting of a parking structure. The self-storage facility will be incorporated into the residential building. Two areas of new offices will be constructed over portions of the existing multi-tenant retail building and the Custom Comfort Mattress store. The office building will be 3 stories in height, with a footprint of 8,000± ft². The existing movie theater and Buco de Beppo restaurant will be demolished as part of the redevelopment. The buildings will be surrounded by asphaltic concrete or Portland cement concrete pavements for automobile parking and drive lanes. The proposed development is also expected to include some areas of concrete flatwork and landscape planters.

Previous Studies

Southern California Geotechnical, Inc. (SCG) was provided with a copy of a previous study conducted for the overall site by Pacific Soils Engineering (PSE). This document was prepared for storm drain improvements that have since been constructed in the eastern region of the Brea Plaza site. The report also included a summary of data collected during previous investigations at the site. A summary of the relevant information pertaining to the subject site from this document is presented below:

> Preliminary Geotechnical Investigation, Proposed Storm Drain Improvements for the Loftus Diversion Channel and the Brea Plaza Shopping Center, Northwest Corner of Imperial Highway and Associated Road, City of Brea, California, Prepared by Pacific Soils Engineering, Inc., dated March 26, 2008, Work Order 500690.

The overall subsurface exploration for this project consisted of thirteen (13) borings and ten (10) cone penetration tests. Boring Nos. HS-03, HS-04, HS-05, and HS-07, as well as CPT Nos. CPT-1, CPT-3, and CPT-4 were within the area of the specific subject site and will be the focus of this summary. The borings were advanced to depths of up to 21½ to 31½± feet below the existing site grades. Engineered fill soils were reportedly encountered beneath the pavements at several of the boring locations. It should be noted that PSE did not provide any documentation to confirm that the existing fill soils were monitored and tested during

placement. The fill soils extended to depths of up to 2 to 10± feet below grade at these boring locations, and generally consisted of medium dense to dense medium dense to dense clayey sand, silty sand and sandy clay. Beneath the fill materials, all of the borings encountered terrace deposits, extending to at least the maximum depth explored of 31± feet. The terrace deposits generally consisted of stiff to hard sandy clay, dense to very dense sandy silt, silty sand, and clayey sand. Occasional layers of gravelly sand and clayey silt were encountered. The results of expansion index testing performed for this report identified low to highly expansive soils at the boring locations. Ground water was encountered at most borings at depths between 10 and 30± feet. The report also notes that layers of perched groundwater were encountered during the investigation.

In Appendix D of this report, a previous report within the subject site was reviewed and summarized:

> Geotechnical Investigation, Proposed Shopping Center, Imperial Highway at Orange Freeway, Brea, California, Prepared by Converse Davis Dixon Associates, dated July 21, 1975, Project No. A-75-587-A.

The exploration for this report consisted of 12 borings advanced to depths of 3 to 30± feet below the site grades. The borings were advanced with a truck-mounted, rotary drilling machine equipped with a 16 to 20-inch diameter drilling bucket. Boring Nos. CD BH-3 through CD BH-5 are located within the subject site. Native alluvial soils were encountered at the ground surface of these 3 borings. The near surface alluvium within the upper 6½± feet generally consisted of stiff to very stiff clay and silty clay. Deeper alluvial soils, extending to at least 20± feet below ground surface, generally consisted of medium dense to very dense silty sand, sandy silt and silt. Occasional layers of very stiff/very dense sandy clay and clayey sand were encountered. Swell tests were conducted on Boring Nos. CD BH-3 and CD BH-5, results showed a 9.7 and 7.7 percent swell, respectively. No groundwater was encountered during the drilling of the relevant borings.

Concurrent Study

Southern California Geotechnical, Inc. (SCG) concurrently conducted a geotechnical investigation at the subject site. As part of this study, four (4) borings were advanced to depths of 25 to 50± feet below existing site grades. Asphaltic concrete pavements were encountered at the ground surface of all boring locations and generally consist of 3 to 8± inches of Asphaltic concrete underlain by 5 to 7± inches of crushed aggregate base. Artificial fill soils were encountered beneath the pavements at Boring Nos. B-2 through B-4, extending to depths of 5½ to 6½± feet below the existing site grades. The artificial fill soils generally consist of medium dense to very dense silty fine sand with trace clay nodules and clayey fine sand, as well as stiff to hard silty clay and fine sandy clay. The fill soils possess a disturbed and mottled appearance with occasional artificial debris content (including fragments of wood, brick and asphaltic concrete) resulting in their classification as artificial fill. Additional soils classified as possible fill were encountered beneath the pavement of Boring No. B-1 and beneath the fill of Boring No. B-4, extending to depths of 5½ to 8½± feet below ground surface. These soils possess similar characteristics to the fill soils, but lack any obvious indicators of fill such as brick or asphaltic concrete fragments. Native terrace deposits were encountered beneath the fill and/or possible fill soils at all of the boring locations, extending to at least the maximum depth

explored of 50± feet below ground surface. The near surface terrace deposits within the upper 5½ to 22± feet generally consist of medium dense to very dense fine sand, silty fine sand and occasionally fine sandy silt. Terrace deposits extending deeper than 22± feet generally consist of very stiff to hard silty clay and fine sandy clay, as well as medium dense fine sand. Occasional layers of medium dense to dense clayey silt and silty fine sand were encountered. Trace to some calcareous nodules were observed in some of the terrace deposits. Boring No. B-1 encountered a fine to coarse sand layer at depths of 17 to 25± feet.

Free water was encountered during the drilling of all boring locations, at depths of 22½ to 23½± feet. A delayed groundwater level reading was taken at Boring No. B-2, 3± hours after the completion of the boring. At this boring location, water was present at a depth of 22½± feet below ground surface during the final measurement. Based on the moisture contents of the recovered soil samples and the delayed water measurements taken within the open boreholes, the static groundwater table is considered to have been present at depths of 22½± feet below the existing site grades at the time of the subsurface investigation.

Subsurface Exploration

Scope of Exploration

The subsurface exploration conducted for the infiltration testing consisted of two (2) infiltration test borings, advanced to depths of 10± feet below the existing site grades. The infiltration borings were advanced using a truck-mounted drill rig, equipped with 8-inch diameter hollow stem augers. The borings were logged during drilling by a member of our staff. The approximate locations of the infiltration test borings (identified as I-1 and I-2) are indicated on the Boring and Infiltration Test Location Plan, enclosed as Plate 2 of this report.

Upon the completion of the infiltration borings, the bottom of each test boring was covered with 2± inches of clean ¾-inch gravel. A sufficient length of 3-inch-diameter perforated PVC casing was then placed into each test hole so that the PVC casing extended from the bottom of the test hole to the ground surface. Clean ¾-inch gravel was then installed in the annulus surrounding the PVC casing.

Geotechnical Conditions

Asphaltic concrete (AC) pavements were encountered at the ground surface at both borings, consisting of 3 to 4± inches of AC underlain by 4 to 6± inches of aggregate base. Artificial fill soils were encountered beneath the AC pavements at both boring locations, extending to depths of 8 to 10± feet below existing site grades. The artificial fill soils consist of medium dense/stiff clayey fine sand, silty fine sand, and silty clay. These soils possess a disturbed and mottled appearance, resulting in their classification as artificial fill. At Infiltration Test No. I-2, terrace deposits were encountered at depths of 8 to 10± feet below existing site grades. The terrace deposits consist of hard fine sandy clay with little silt, trace amounts of medium to coarse sand, and little calcareous veining/nodules. The Boring Logs, which give detailed illustrations of the conditions encountered at the boring locations are included with this report.

Free water was encountered during the drilling of the boring locations performed during the concurrent study (Boring Nos. B-1 through B-4), at a depth of 23½± feet. A delayed

groundwater level reading was taken at Boring No. B-2, 3± hours after the completion of the boring. At this boring location, water was present at a depth of 22½± feet below ground surface during the final measurement. Based on the moisture contents of the recovered soil samples and the delayed water measurements taken within the open boreholes, the static groundwater table is considered to have been present at a depth of 22½± feet below the existing site grades at the time of the subsurface investigation.

As part of our research, we reviewed readily available groundwater data in order to determine regional groundwater depths. Recent water level data was obtained from the California State Water Resources Control Board, GeoTracker, website, http://geotracker.waterboards.ca.gov/. The nearest monitoring well on record is located approximately 475 feet southeast of the site. Water level readings within this monitoring well indicate a high groundwater level of 18± feet below the ground surface, in December 2011.

To confirm soil conditions beneath the infiltration test depths (10± feet), SCG reviewed the nearby boring logs (HS-3 and CD BH-3) from the previous studies conducted at the subject site. At Boring No. HS-3, the soils from depths of 10 to 20± feet consisted of stiff sandy clay terrace deposits. Groundwater was encountered at a depth of 26± feet below ground surface at the time of drilling. At Boring No. CD BH-3 the soils from depths of 10 to 16± feet (maximum depth explored) consisted of very stiff sandy clay and very dense clayey sand. No groundwater was encountered during drilling.

Infiltration Testing

As previously mentioned, the infiltration testing was performed in general accordance with the Orange County guidelines: Technical Guidance Document for the Preparation of Conceptual/Preliminary and/or Project Water Quality Management Plans (WOMPs), Appendix VII.

Pre-soaking

In accordance with the county infiltration standards, both of the infiltration test borings were pre-soaked prior to the infiltration testing. The pre-soaking process consisted of filling the test borings by inverting a full 5-gallon bottle of clear water supported over each hole so that the water level reaches a level of at least 5 times the hole's radius above the gravel at the bottom of each hole. The pre-soaking was completed after all of the water had percolated through each test hole or after 15 hours since initiating the pre-soak.

Infiltration Testing

Following the pre-soaking process of the infiltration test borings, SCG performed the infiltration testing. Each test hole was filled with water to a depth of at least 5 times the hole's radius above the gravel at the bottom of each test hole, and less than or equal to the water level used during the pre-soaking process. In accordance with the Orange County guidelines, since "other soils" were encountered at the bottom of both of the infiltration borings, readings were taken at 30-minute intervals for a total of 6 hours. After each reading, the borings were refilled to the correct water level above the gravel at the bottom of each test hole. The water level readings

are presented on the spreadsheets enclosed with this report. The infiltration rates for each of the timed intervals are also tabulated on the spreadsheets.

The infiltration rates from the test are tabulated in inches per hour. In accordance with the typically accepted practice, it is recommended that the most conservative reading from the latter part of the infiltration tests be used as the design infiltration rate. The rates are summarized below:

Infiltration Test No.	Depth (feet)	Soil Description	Infiltration Rate (inches/hour)
I-1	10	Brown Silty Clay, little fine Sand, trace medium Sand	0.03
I-2	10	Brown fine Sandy Clay, little Silt, trace medium to coarse Sand	0.36

Laboratory Testing

Moisture Content

The moisture contents for the recovered soil samples were determined in accordance with ASTM D-2216 and are expressed as a percentage of the dry weight. These test results are presented on the Boring Logs.

Grain Size Analysis

The grain size distribution of selected soils collected from the bottom of each infiltration test boring have been determined using a range of wire mesh screens. These tests were performed in general accordance with ASTM D-422 and/or ASTM D-1140. The weight of the portion of the sample retained on each screen is recorded and the percentage finer or coarser of the total weight is calculated. The results of these tests are presented on Plates C-1 and C-2 of this report.

Design Recommendations

Two (2) infiltration tests were performed at the subject site. The infiltration rates at these locations range from 0.03 to 0.36 inches per hour. The major factors affecting the lack of infiltration at these borings is the presence of medium stiff to hard clayey soils at the test depths. **Although an infiltration rate of 0.36 inches per hour was calculated for Infiltration Test No. I-2, negligible infiltration was measured at Infiltration Test Nos. I-1. Therefore, infiltration is not considered feasible for this site, due to the test results and the type of soils encountered at the boring locations.**

General Comments

This report has been prepared as an instrument of service for use by the client in order to aid in the evaluation of this property and to assist the architects and engineers in the design and preparation of the project plans and specifications. This report may be provided to the

contractor(s) and other design consultants to disclose information relative to the project. However, this report is not intended to be utilized as a specification in and of itself, without appropriate interpretation by the project architect, structural engineer, and/or civil engineer. The design of the infiltration system is the responsibility of the civil engineer. The role of the geotechnical engineer is limited to determination of infiltration rate only. By using the design infiltration rates contained herein, the civil engineer agrees to indemnify, defend, and hold harmless the geotechnical engineer for all aspects of the design and performance of the infiltration system. The reproduction and distribution of this report must be authorized by the client and Southern California Geotechnical, Inc. Furthermore, any reliance on this report by an unauthorized third party is at such party's sole risk, and we accept no responsibility for damage or loss which may occur. The analysis of this site was based on a subsurface profile interpolated from limited discrete soil samples. While the materials encountered in the project area are considered to be representative of the total area, some variations should be expected between trench locations and testing depths. If the conditions encountered during construction vary significantly from those detailed herein, we should be contacted immediately to determine if the conditions alter the recommendations contained herein.

This report has been based on assumed or provided characteristics of the proposed development. It is recommended that the owner, client, architect, structural engineer, and civil engineer carefully review these assumptions to ensure that they are consistent with the characteristics of the proposed development. If discrepancies exist, they should be brought to our attention to verify that they do not affect the conclusions and recommendations contained herein. We also recommend that the project plans and specifications be submitted to our office for review to verify that our recommendations have been correctly interpreted. The analysis, conclusions, and recommendations contained within this report have been promulgated in accordance with generally accepted professional geotechnical engineering practice. No other warranty is implied or expressed.

Closure

We sincerely appreciate the opportunity to be of service on this project. We look forward to providing additional consulting services during the course of the project. If we may be of further assistance in any manner, please contact our office.

Respectfully Submitted,

SOUTHERN CALIFORNIA GEOTECHNICAL, INC.

BORING LOG LEGEND

SAMPLE TYPE	GRAPHICAL SYMBOL	SAMPLE DESCRIPTION
AUGER		SAMPLE COLLECTED FROM AUGER CUTTINGS, NO FIELD MEASUREMENT OF SOIL STRENGTH. (DISTURBED)
CORE		ROCK CORE SAMPLE: TYPICALLY TAKEN WITH A DIAMOND-TIPPED CORE BARREL. TYPICALLY USED ONLY IN HIGHLY CONSOLIDATED BEDROCK.
GRAB		SOIL SAMPLE TAKEN WITH NO SPECIALIZED EQUIPMENT, SUCH AS FROM A STOCKPILE OR THE GROUND SURFACE. (DISTURBED)
CS		CALIFORNIA SAMPLER: 2-1/2 INCH I.D. SPLIT BARREL SAMPLER, LINED WITH 1-INCH HIGH BRASS RINGS. DRIVEN WITH SPT HAMMER. (RELATIVELY UNDISTURBED)
NSR		NO RECOVERY: THE SAMPLING ATTEMPT DID NOT RESULT IN RECOVERY OF ANY SIGNIFICANT SOIL OR ROCK MATERIAL.
SPT		STANDARD PENETRATION TEST: SAMPLER IS A 1.4 INCH INSIDE DIAMETER SPLIT BARREL, DRIVEN 18 INCHES WITH THE SPT HAMMER. (DISTURBED)
SH		SHELBY TUBE: TAKEN WITH A THIN WALL SAMPLE TUBE, PUSHED INTO THE SOIL AND THEN EXTRACTED. (UNDISTURBED)
VANE		VANE SHEAR TEST: SOIL STRENGTH OBTAINED USING A 4 BLADED SHEAR DEVICE. TYPICALLY USED IN SOFT CLAYS-NO SAMPLE RECOVERED.

COLUMN DESCRIPTIONS

DEPTH: Distance in feet below the ground surface.

SAMPLE: Sample Type as depicted above.

BLOW COUNT: Number of blows required to advance the sampler 12 inches using a 140 lb hammer with a 30-inch drop. 50/3" indicates penetration refusal (>50 blows) at 3 inches. WH indicates that the weight of the hammer was sufficient to push the sampler 6 inches or more.

POCKET PEN.: Approximate shear strength of a cohesive soil sample as measured by pocket penetrometer.

GRAPHIC LOG: Graphic Soil Symbol as depicted on the following page.

DRY DENSITY: Dry density of an undisturbed or relatively undisturbed sample in lbs/ft^3.

MOISTURE CONTENT: Moisture content of a soil sample, expressed as a percentage of the dry weight.

LIQUID LIMIT: The moisture content above which a soil behaves as a liquid.

PLASTIC LIMIT: The moisture content above which a soil behaves as a plastic.

PASSING #200 SIEVE: The percentage of the sample finer than the #200 standard sieve.

UNCONFINED SHEAR: The shear strength of a cohesive soil sample, as measured in the unconfined state.

	Final	1:05 PM		8.16			

Per County Standards, Infiltration Rate calculated as follows:

$$Q = \frac{\Delta H(60r)}{\Delta t(r + 2H_{avg})}$$

Where: Q = Infiltration Rate (in inches per hour)
ΔH = Change in Height (Water Level) over the time interval
r = Test Hole (Borehole) Radius
Δt = Time Interval
H_{avg} = Average Head Height over the time interval

Non-Structural Source Control BMPs			
Y	N1. Education for Property Owners, Tenants and Occupants Educational materials shall be reviewed and made available on-site prior to commencement of operation of the Brea Plaza Redevelopment Project. Refer to Appendices A and B of the Project WQMP for a list of applicable educational materials and BMP Fact Sheets. For developments with POA and residential projects of more than fifty (50) dwelling units, project conditions of approval will require that the POA periodically provide environmental awareness education materials, made available by the municipalities, to all of its members. Among other things, these materials will describe the use of chemicals (including household type) that should be limited to the property, with no discharge of wastes via hosing or other direct discharge to gutters, catch basins and storm drains. Educational materials available from the County of Orange can be downloaded here: http://www.ocwatersheds.com/PublicEd/resources/default.aspx	Frequency: Upon occupancy, and annually thereafter	BPI Brea LLC (Owner) 417 S. Associated Road, Suite 313 Brea, CA 92821 Contact: Waad Nadhir wnadhir@bosc.com

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Y	N2. Activity Restrictions The owner shall include in any employee training manual, lease, and/or CCRs the on-site activity restrictions, including but not limited to: (1) No hosing down of any paved surface where the water would flow directly to the street, gutter or storm drain; (2) No car washing outside of established community car wash areas (if any); and (3) No disposal of wash water in the street, gutter or storm drain—all wash water must be disposed of in a mop sink or an area with a floor drain.	Frequency: Continuous	BPI Brea LLC (Owner) 417 S. Associated Road, Suite 313 Brea, CA 92821 Contact: Waad Nadhir wnadhir@bosc.com
Y	N3. Common Area Landscape Management Ongoing maintenance must be consistent with the City's adopted water conservation ordinance, plus fertilizer and pesticide usage consistent with the "County Management Guidelines for Use of Fertilizers and Pesticides." Landscaping irrigation systems shall be adjusted and properly maintained to prevent over spray runoffs. Green waste shall not be blown or swept into, or disposed of, in the street, gutter, public right-of-way, or storm drain catch basins or inlets. Leaf blowers, if used, shall be used to move green waste into piles so they can be swept and picked up and disposed of in green waste recycling containers.	Frequency: Weekly	BPI Brea LLC (Owner) 417 S. Associated Road, Suite 313 Brea, CA 92821 Contact: Waad Nadhir wnadhir@bosc.com

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Y	N4. BMP Maintenance Owner shall be responsible for implementation of each non-structural BMP and regularly scheduled cleaning of all BMP structural facilities. Records of inspections and BMP maintenance shall be maintained by the owner and shall be available for review upon request.	Frequency: Continuous	BPI Brea LLC (Owner) 417 S. Associated Road, Suite 313 Brea, CA 92821 Contact: Waad Nadhir wnadhir@bosc.com
N	N5. Title 22 CCR Compliance		
N	N6. Local Water Quality Permit Compliance		
N	N7. Spill Contingency Plan		
N	N8. Underground Storage Tank Compliance		
N	N9. Hazardous Materials Disclosure Compliance		
N	N10. Uniform Fire Code Implementation		

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Y	N11. Common Area Litter Control The Owner shall provide an adequate number of trash receptacles on site. Litter patrol, emptying of trash receptacles, violation investigation, reporting and other litter control activities shall be performed in conjunction with maintenance activities.	Frequency: Weekly	BPI Brea LLC (Owner) 417 S. Associated Road, Suite 313 Brea, CA 92821 Contact: Waad Nadhir wnadhir@bosc.com
Y	N12. Employee Training The Owner shall prepare a training manual(s) for existing and future employees. The manual should include information on non-point source pollution and how to use proper Best Management Practices (BMPs) to minimize runoff pollutants. Training shall be provided upon hire and at regular intervals thereafter.	Frequency: Upon hire, and annually thereafter	BPI Brea LLC (Owner) 417 S. Associated Road, Suite 313 Brea, CA 92821 Contact: Waad Nadhir wnadhir@bosc.com

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Y	N13. Housekeeping of Loading Docks Keep all fluids indoors. Clean up spills immediately and keep spills from entering storm drain system. Cleanup procedures should minimize or eliminate the use of water. If wash water is used, it must be disposed of in an approved manner and not discharged to the storm drain system. If there are no other alternatives, discharge of non-stormwater flow to the sanitary sewer must be at an acceptable discharge point such as a cleanout, oil/water separator, grease interceptor, or industrial sewer connection. All sewer discharges shall be in accordance with the Orange County Sanitation District's Wastewater Discharge Regulations and/or Washwater Disposal Guidelines. Area shall be inspected weekly for proper containment and shall be swept weekly.	Frequency: Continuous	BPI Brea LLC (Owner) 417 S. Associated Road, Suite 313 Brea, CA 92821 Contact: Waad Nadhir wnadhir@bosc.com
Y	N14. Common Area Catch Basin Inspection The catch basins will be inspected, cleaned and maintained on an annual basis, in the early fall prior to the start of the rainy season, and before and after all major storms.	Frequency: Annually, and before and after all major storms	BPI Brea LLC (Owner) 417 S. Associated Road, Suite 313 Brea, CA 92821 Contact: Waad Nadhir wnadhir@bosc.com

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Y	N15. Street Sweeping Private Streets and Parking Lots The Owner or his agent must sweep all drive aisles and parking areas regularly (minimum monthly), and prior to the storm season (no later than October 1st each year). Sweeping shall be done with a vacuum-type sweeper. Under no circumstances are outdoor areas/lots to be rinsed or washed with water unless said rinse/wash water is collected and disposed of properly (i.e. into the sewer).	Frequency: Monthly	BPI Brea LLC (Owner) 417 S. Associated Road, Suite 313 Brea, CA 92821 Contact: Waad Nadhir wnadhir@bosc.com

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Structural Source Control BMPs			
Y	S1. Provide Storm Drain System Stenciling and Signage Storm drain stencils are highly visible source control messages, typically placed directly adjacent to storm drain inlets. The stencils contain a brief statement that prohibits the dumping of improper materials into the municipal storm drain system. Graphical icons, either illustrating anti-dumping symbols or images of receiving water fauna, are effective supplements to the anti-dumping message. Stencils and signs alert the public to the destination of pollutants discharged into stormwater. The following requirements should be included in the project design and shown on the project plans: 1. Provide stenciling or labeling of all storm drain inlets and catch basins, constructed or modified, within the project area with prohibitive language (such as: "NO DUMPING-DRAINS TO OCEAN") and/or graphical icons to discourage illegal dumping. 2. Post signs and prohibitive language and/or graphical icons, which prohibit illegal dumping at public access points along channels and creeks within the project area. 3. Maintain legibility of stencils and signs. See CASQA Stormwater Handbook BMP Fact Sheet SD-13 for additional information. Storm drain stencils shall be inspected for legibility, at a minimum, once prior to the storm season, and no later than October 1st of each year. Those signs determined to be illegible will be re-stenciled as soon as possible.	Frequency: Annually	BPI Brea LLC (Owner) 417 S. Associated Road, Suite 313 Brea, CA 92821 Contact: Waad Nadhir wnadhir@bosc.com

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
N	S2. Design Outdoor Hazardous Material Storage Areas to Reduce Pollutant Introduction		
N	S3. Design Trash Enclosures to Reduce Pollutant Introduction		

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Y	S4. Use Efficient Irrigation Systems & Landscape Design Projects shall design the timing and application methods of irrigation water to minimize the runoff of excess irrigation water into the municipal storm drain system. The following methods to reduce excessive irrigation runoff shall be considered, and incorporated on common areas of development and other areas where determined applicable and feasible by the Permittee: 1. Employing rain shutoff devices to prevent irrigation after precipitation. 2. Designing irrigation systems to each landscape area's specific water requirements. 3. Using flow reducers or shutoff valves triggered by a pressure drop to control water loss in the event of broken sprinkler heads or lines. 4. Implementing landscape plan consistent with County Water Conservation Resolution or city equivalent, which may include provision of water sensors, programmable irrigation times (for short cycles), etc. 5. The timing and application methods of irrigation water shall be designed to minimize the runoff of excess irrigation water into the municipal storm drain system. 6. Employing other comparable, equally effective, methods to reduce irrigation water runoff. 7. Group plants with similar water requirements in order to reduce excess irrigation runoff and promote surface filtration. Choose plants with low irrigation requirements (for example, native or drought tolerant species). Consider other design features, such as:	Frequency: Continuous	BPI Brea LLC (Owner) 417 S. Associated Road, Suite 313 Brea, CA 92821 Contact: Waad Nadhir wnadhir@bosc.com

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Y	S4. Use Efficient Irrigation Systems & Landscape Design (cont'd) • Use mulches (such as wood chips or shredded wood products) in planter areas without ground cover to minimize sediment in runoff. • Install appropriate plant materials for the location, in accordance with amount of sunlight and climate, and use native plant material where possible and/or as recommended by the landscape architect. • Leave a vegetative barrier along the property boundary and interior watercourses, to act as a pollutant filter, where appropriate and feasible. • Choose plants that minimize or eliminate the use of fertilizer or pesticides to sustain growth. Irrigation practices shall comply with local and statewide ordinances related to irrigation efficiency.	Frequency: Continuous	BPI Brea LLC (Owner) 417 S. Associated Road, Suite 313 Brea, CA 92821 Contact: Waad Nadhir wnadhir@bosc.com
N	S5. Protect Slopes and Channels		

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Y	S6. Loading Dock Areas Loading /unloading dock areas shall include the following: 1. Cover loading dock areas, or design drainage to preclude run-on and runoff, unless the material loaded and unloaded at the docks does not have potential to contribute to stormwater pollution, and this use is ensured for the life of the facility. 2. Direct connections to the municipal storm drain system from below grade loading docks (truck wells) or similar structures are prohibited. Stormwater can be discharged through a permitted connection to the storm drain system with a treatment control BMP applicable to the use. 3. Other comparable and equally effective features that prevent unpermitted discharges to the municipal storm drain system. 4. Housekeeping of loading docks shall be consistent with N13. BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Low Impact Development BMPs			
Y	Treatment Control BMP #1 Proprietary Catch Basin Insert Filters (Kristar FloGard +Plus Insert Filters or Approved Equivalent) Twice a year, prior to and after the rainy season, and after major storm events, the catch basin insert filters shall be visually inspected for damage, have all sediment and debris removed, and the filter medium pouches shall be replaced if necessary. The owner may conduct this maintenance himself, or may enter into a service contract for the maintenance of the insert filters as detailed in the Kristar FloGard +Plus Specs/Maintenance Requirements brochure, a copy of which is attached hereto.	Frequency: Every Six Months (Approximately April 1st and October 1st) and Immediately After Major Storm Events	BPI Brea LLC (Owner) 417 S. Associated Road, Suite 313 Brea, CA 92821 Contact: Waad Nadhir wnadhir@bosc.com

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Y	Biotreatment BMP # 1 Modular Wetlands System (BIO-7: Proprietary Biotreatment) The Modular Wetlands System is to be maintained monthly as part of routine landscape maintenance activities, and shall be visually inspected monthly and immediately after major storm events to remove collected litter and foreign debris from the screening device. Every 12 to 24 months, the following maintenance should be performed: remove sediment from the Separation Chamber, replace the Cartridge Filter Media, and replace the Drain Down Filter Media. Additional/detailed maintenance instructions for the Modular Wetlands System are contained in the "Maintenance Guidelines for Modular Wetlands System," a copy of which is attached hereto.	Frequency: Screening Device Maintenance: Monthly And Immediately After Major Storm Events Separation Chamber, Cartridge Filter Media, and Drain Down Filter Media Maintenance: Every 12 to 24 Months	BPI Brea LLC (Owner) 417 S. Associated Road, Suite 313 Brea, CA 92821 Contact: Waad Nadhir wnadhir@bosc.com

Required Permits

No permits are required for the implementation, operation, and maintenance of the BMPs described in this plan.

Recordkeeping

All records must be maintained for at least five (5) years and must be made available for review upon request.

Inspection Checklist

Modular Wetland System Type (Curb, Grate or UG Vault): _____ Size (22', 14' or etc.): _____

Structural Integrity:	**Yes**	**No**	**Comments**
Damage to pre-treatment access cover (manhole cover/grate) or cannot be opened using normal lifting pressure?			
Damage to discharge chamber access cover (manhole cover/grate) or cannot be opened using normal lifting pressure?			
Does the MWS unit show signs of structural deterioration (cracks in the wall, damage to frame)?			
Is the inlet/outlet pipe or drain down pipe damaged or otherwise not functioning properly?			
Working Condition:			
Is there evidence of illicit discharge or excessive oil, grease, or other automobile fluids entering and clogging the unit?			
Is there standing water in inappropriate areas after a dry period?			
Is the filter insert (if applicable) at capacity and/or is there an accumulation of debris/trash on the shelf system?			
Does the depth of sediment/trash/debris suggest a blockage of the inflow pipe, bypass or cartridge filter? If yes, specify which one in the comments section. Note depth of accumulation in in pre-treatment chamber.			Depth:
Does the cartridge filter media need replacement in pre-treatment chamber and/or discharge chamber?			Chamber:
Any signs of improper functioning in the discharge chamber? Note issues in comments section.			
Other Inspection Items:			
Is there an accumulation of sediment/trash/debris in the wetland media (if applicable)?			
Is it evident that the plants are alive and healthy (if applicable)? Please note Plant Information below.			
Is there a septic or foul odor coming from inside the system?			

Waste:	**Yes**	**No**
Sediment / Silt / Clay		
Trash / Bags / Bottles		
Green Waste / Leaves / Foliage		

Recommended Maintenance	
No Cleaning Needed	
Schedule Maintenance as Planned	
Needs Immediate Maintenance	

Plant Information	
Damage to Plants	
Plant Replacement

NOTICE OF TRANSFER OF RESPONSIBILITY FOR WQMP

NOTICE OF TRANSFER OF RESPONSIBILITY

WATER QUALITY MANAGEMENT PLAN

BREA PLAZA MIXED-USE PROJECT

1639 E. Imperial Highway
Brea, CA 92821

Submission of this Notice of Transfer of Responsibility constitutes notice to the City of Brea that responsibility for the Water Quality Management Plan ("WQMP") for the subject property identified below, and implementation of that plan, is being transferred from the Previous Owner (and its agent) of the site (or a portion thereof) to the New Owner, as further described below.

I. Previous Owner/ Previous Responsible Party Information

Company/ Individual Name:		Contact Person:	
Street Address:		Title:	
City:	State:	ZIP:	Phone:

II. Information About Site Transferred

Name of Project (if applicable):	
Title of WQMP Applicable to site:	
Street Address of Site (if applicable):	
Planning Area (PA) and/ or Tract Number(s) for Site:	Lot Numbers (if Site is a portion of a tract):
Date WQMP Prepared (and revised if applicable):	

III. New Owner/ New Responsible Party Information

Company/ Individual Name:		Contact Person:	
Street Address:		Title:	
City:	State:	ZIP:	Phone:

IV. Ownership Transfer Information

General Description of Site Transferred to New Owner:	General Description of Portion of Project/ Parcel Subject to WQMP Retained by Owner (if any):

Lot/ Tract Numbers of Site Transferred to New Owner:
Remaining Lot/ Tract Numbers Subject to WQMP Still Held by Owner (if any):
Date of Ownership Transfer:

Note: When the Previous Owner is transferring a Site that is a portion of a larger project/ parcel addressed by the WQMP, as opposed to the entire project/parcel addressed by the WQMP, the General Description of the Site transferred and the remainder of the project/ parcel not transferred shall be set forth as maps attached to this notice. These maps shall show those portions of a project/ parcel addressed by the WQMP that are transferred to the New Owner (the Transferred Site), those portions retained by the Previous Owner, and those portions previously transferred by Previous Owner. Those portions retained by Previous Owner shall be labeled as "Previously Transferred".

V. Purpose of Notice of Transfer

The purposes of this Notice of Transfer of Responsibility are: 1) to track transfer of responsibility for implementation and amendment of the WQMP when property subject to the WQMP is transferred from the Previous Owner to the New Owner, and 2) to facilitate notification to a transferee of property subject to a WQMP that such New Owner is now the Responsible Party of record for the WQMP for those portions of the site that it owns.

VI. Certifications

A. Previous Owner

I hereby certify that _____is no longer the owner of the Transferred Site as described in Section II above. I have provided the New Owner with a copy of the WQMP applicable to the Transferred Site that the New Owner is acquiring from the Previous Owner.

Printed Name of Previous Owner Representative:	Title:
Signature:	Date:

B. New Owner

I hereby certify that _____is the owner of the Transferred Site, as described in Section II above, that I have been provided a copy of the WQMP, and that I have been informed and understand the New Owner's responsibilities related to the WQMP, its implementation, and Best Management Practices associated with it. I understand that by signing this notice, the New Owner is accepting all ongoing responsibilities for implementation and amendment of the WQMP for the Transferred Site, which the New Owner has acquired from the Previous Owner.

Printed Name of New Owner Representative:	Title:
Signature:	Date:

AGREEMENT OF WATER QUALITY MANAGEMENT PLAN

OWNER: **CALIFORNIA BREA PARTNERS, LP**

PROPERTY ADDRESS: **825 EAST IMPERIAL HIGHWAY AND 1647 ASSOCIATED ROAD, BREA, CA**

3P
1 CC

THIS AGREEMENT is made and entered into in BREA, California, this 2nd day of FEB, 2010, by and between CALIFORNIA BREA PARTNERS, LP, herein after referred to as "Owner" and the City of Brea ("City"), a municipal corporation.

RECITALS

WHEREAS, the undersigned is the owner of certain real property located in the City of Brea, County of Orange, State of California legally described as Parcels 1-13 inclusive, as per map recorded in book 105, pages 17, 18 and 19 of Parcel map, records of Orange County, in the City of Brea, CA and hereto referred to as (the "Real Property").

WHEREAS, the undersigned is seeking certain permits and approvals from the City for the development of the Real Property as follows: Precise Grading and Building Permit (the "Approvals")

WHEREAS, in consideration of the City granting Approvals, I the undersigned, agree to and accept the terms and conditions of the Water Quality Management Plan (the "Plan") approved by the City's Engineering Department on _____, and bind the Real Property with the provisions of the Plan, which is on file with the City of Brea's Engineering Division, File No. PD 09-01.

WHEREAS, in consideration of the City granting the Approvals, the undersigned has agreed to and accepts the terms and conditions of the Plan as it relates to the Real Property and agrees that the Real Property shall be bound by and subject to the Plan.

NOW, THEREFORE, it is hereby agreed by the undersigned as follows:

1. The undersigned hereby agrees to the terms and conditions of the Plan, the previsions of which re incorporated by reference as though set out herein in full, and agrees that the Real Property shall be bound by and subject to the terms and conditions of the Plan.
2. The undersigned agrees to conduct the necessary routine maintenance of any structural devices designed into or installed as part of the storm water drainage system on the Real Property to reduce pollutants in storm water runoff to the maximum extent practicable through the lifetime of the development which is the subject of Approvals.
3. The undersigned agrees to hold the City, its officials, officers, employees, volunteers, and agents free and harmless from and any all claims, demands, causes of action, costs, expenses, liability, loss, damage, or injury, in law or equity, to property or persons, arising from the imposition of the Plan by the City.
4. The agreements contained herein and the terms and conditions of the Plan are covenants intended to run with the land and shall burden the Real Property and shall be binding upon future owners of all or any portion of the Real Property. Upon a transfer of the Real Property, the transferor (including the undersigned) shall be relieved of any obligations under this Memorandum or the Plan arising from and after the effective date of the transfer.
5. The provisions of this Memorandum are intended to constitute equitable servitudes which shall encumber the Real Property and be binding upon future owners of the Real Property or any portion thereof.
6. The provisions of the Memorandum may be enforced by the City, which, among other remedies, shall have the remedy of injunctive relief and other equitable remedies.
7. This Memorandum shall not be amended, modified or terminated without the prior written consent of the city, which consent, to be effective, shall be contained in a document executed by the City and recorded against the Real Property.

Water Quality Management Plan
for
Brea Plaza
Parcel Map Book 105/17-19

This Water Quality Management Plan (WQMP) for the Brea Plaza commercial redevelopment has been prepared for Bosc Equities by Pardue, Cornwell & Associates, Inc.. This WQMP is intended to comply with the requirements of the City of Brea Municipal Code (Chapter 13.32), requiring preparation of a project-specific WQMP.

The undersigned, while it owns the subject property, is responsible for the implementation of the provisions of this plan and will ensure that this plan is amended as appropriate to reflect up-to-date conditions on the site consistent with the current Orange County Drainage Area Management Plan (DAMP), and the intent of the stormwater and urban runoff NPDES Permit and Waste Discharge Requirements for the County of Orange, Orange County Flood Control District and the incorporated Cities of Orange County under the jurisdiction of the San Diego Regional Water Quality Control Board. A copy of this WQMP will be maintained at the project site or project office.

This WQMP will be reviewed with the facility operator, facility supervisors, employees, tenants, maintenance and service contractors, or any other party having responsibility for implementing portions of this WQMP. At least one copy of the approved and certified copy of this WQMP shall be available on the subject property in perpetuity. Once the undersigned transfers its interest in the property, its successors-in-interest shall bear the aforementioned responsibility to implement and amend the WQMP.

C. Additional Permits & Certifications

I. Discretionary Permit Number(s), Water Quality Condition Number(s) and Conditions

The applicant shall prepare and provide a WQMP incorporating both construction and post construction pollution prevention controls for the entire site, prior to the issuance of a grading/demolition permit and subject to review and approval of the City Engineer.

There are currently three other permits being held by Bosc Equities regarding this project. They are as follows:

- 401 Certification for the California Regional Water Quality Control Board, dated August 8, 2008 for the Loftus Channel
    - 401 Certification, Condition No. 3: "California Brea Partners, LP must implement a water quality monitoring program for the purpose of evaluating the performance of the Baffle Filters® as analyzed in the Anti-degradation Analysis performed for the proposed project. The water quality monitoring program must compliment the monitoring being performed by permittees under Order No. R8-2002-0010, NPDES Permit No. CAS618030, commonly known as the Orange County Municipal Storm Water Permit. A draft monitoring plan must be provided to the Executive Officer for approval by October 7, 2008. The monitoring plan must be fully implemented upon approval."
    - 401 Certification, Condition No. 4: "In the event that the proposed Baffle Filters® do not achieve reductions for pollutants of concern identified in the Anti-degradation Analysis that are equivalent to the natural pollutant attenuation function of the filled channel, California Brea Partners, LP must implement additional best management practices to replace the natural pollutant attenuation function of the filled Loftus Channel. California Brea Partners, LP may at any time update the natural pollutant attenuation rates in the Anti-degradation Analysis using the best available scientific information."
    - 401 Certification, Condition No. 5: "The applicant must comply with the requirements of the Clean Water Act section 404 permit."
- California Department of Fish & Game Permit No. 1600-2008-0029-R5 for the Loftus Channel
- U.S. Army Corps. Of Engineers Permit No. SPL-2008-00232-JPL for the Loftus Channel

The City of Brea has also prepared Condition of Approval for this project, dated December 8, 2009

Conditions of Approval information:

- Resolution No. PC-09-29
- Precise Development No. PD 09-01
- Conditional Use Permit No. CUP 09-14
- Adopting Mitigated Negative Declaration No. 08-01 II.

Note: Conditions of Approval are attached as Appendix "B" & Additional Permits are attached as Appendix "C".

II. Project Description

Bosc Equities proposes the redevelopment of portions of the existing "Brea Plaza" Shopping Center. The site consists of approximately 13.72 acres along Associated Road, and is located at the northwest intersection of Imperial Highway and Associated Road, in the City of Brea. A Location Map is provided under Section VI as Exhibit "A" of this WQMP.

Proposed redevelopment to the existing site includes the removal of existing improvements (including building structures, parking lot, landscaping, wet and dry utilities and bridge crossing) for the construction of six (6) new building structures, parking lots, landscaping and storm drain improvements, wet and dry utilities, curb, sidewalk and gutter, access drives and other retail commercial site related improvements.

The project also proposes to convert the portion of Orange County Flood Control District (OCFCD) facility A06 Loftus Channel located east of Brea Plaza, which currently consists of an open channel facility with revetted side slopes and an earthen bottom, to a covered box culvert to allow for additional parking for Brea Plaza. Channel improvements will include the construction of a 55-foot wide, four (4) cell reinforced concrete box culvert in place of the existing open channel. The improvements will extend north approximately 900± lineal feet from Imperial Highway. This portion of the redevelopment consists of approximately 2.0 acres and will also include landscaping, sidewalks, vegetated swales, storm drains, catch basins and related improvements, and other utilities. A Site Map is provided under Section VI as Exhibit "B" of this WQMP.

North East Area: demolition and reconstruction of portions of the existing buildings, parking, and drive aisles. South East Area: demolition and reconstruction of the existing building, parking, and drive aisles. Westerly Area: demolition and reconstruction of the existing buildings, parking, and drive aisles. Anticipated uses include SIC Division G – Retail Trade and 5812 – Eating Places (restaurants).

Paved areas of the site include the parking aisles, drives, parking lot, curb, sidewalk and gutter improvements, entrances, and building pad areas. Total roof and paved areas will consist of approximately 90% of the site. The locations of these areas are depicted in the WQMP Site Plan (Section VI).

Parking for the site will be provided via the existing shopping center parking lot and proposed parking lots within the redevelopment areas, as depicted in the WQMP Site Plan. A total of 757 parking spaces will be provided within project area. Total project parking spaces shall be consistent with the City of Brea parking regulations, standards and requirements.

Landscape areas include landscaping adjacent to proposed buildings, landscaping within the parking areas and walkways, and the project's four (4) proposed vegetated treatment swales. Total landscaping will consist of approximately 1.4 acres, or 10% of the redeveloped site. Landscaping may be planted with preferably native, drought-tolerant landscaping per the approved landscaping plan, irrigated with installed efficient irrigation improvements. All proposed landscaping will be maintained by the Owner.

Restaurants and food-preparation areas will not employ garbage disposals and will discourage the disposal of food wastes to the sanitary sewer system. The restaurant will have a grease interceptor to help minimize the effects of Food, Oils and Grease (FOG) on the sanitary sewer. Final location of the grease interceptor will be determined as tenants are identified. Food Preparation areas will additionally follow BMP guidelines specified in IC-22 - Eating and Drinking Establishments.

Outdoor activities for the project include commuting, working, materials delivery, loading and unloading, walking, eating and other activities characteristic of retail/commercial and business developments.

There is no outdoor storage of materials permitted onsite. Each tenant shall be required to store all materials within the tenant's private use areas, located inside the building structures. Material delivery, loading and unloading areas will be located as shown in the WQMP Site Plan. No designated loading docks are proposed within the scope of proposed improvements.

Normal commercial facility related trash can be expected to be produced daily by each tenant. Such trash will be disposed of by the responsible personnel to the trash enclosures provided, to be removed by the local private waste management company on a weekly basis, or as needed, for proper disposal to a central trash disposal facility offsite. All trash enclosures shall be enclosed and protected from storm water run-on. The enclosure pad shall be designed in a sump condition to prevent the discharge of any liquids from the enclosure. Additionally, runoff from the enclosure area is prohibited from entering the storm drain system.

The anticipated storm water or urban runoff pollutants reasonably expected to be associated with this project are:

1. *Bacteria and viruses.* Anticipated sources include animal excrement (found in areas where pets are often walked), sanitary sewer overflow, and trash container handling areas.
2. *Metals.* Potential sources of trace metals (copper, lead, cadmium, chromium, nickel and zinc) include motor vehicles, re-roofing and hardscape/construction materials, and chemicals.
3. *Organic Compounds.* These compounds can be expected to be derived from automotive fluids, pesticides, and fertilizers.
4. *Trash and Debris.* These sources include common litter, biodegradable organic matter such as leaves, grass cuttings and food wastes from landscaped areas and homeowners.
5. *Oxygen-Demanding Substances.* Potential sources include biodegradable organic materials and various chemicals and food wastes, which deplete dissolved oxygen levels in water courses.
6. *Oil and Grease.* Potential sources of oil and grease include motor vehicles.

The potential storm water or urban runoff pollutants reasonably expected to be associated with this project are:

1. *Nutrients.* Nutrients, including nitrogen, phosphorous, and other compounds can be anticipated to be generated by or found in organic litter, fertilizers, food waste, sewage and sediment.
2. *Pesticides.* Potential source includes project landscaping areas.
3. *Sediment.* Potential source includes project landscaping areas.

III. Site Description

This project site consists of the various areas of the Brea Plaza Shopping Center, located just at the northwest intersection of Imperial Highway and Associated Road, in the City of Brea, California. The approximately 13.72-acre site is designated by the City of Brea for General Commercial (GC) use. The site is bound to the north by a commercial office center and low density residential housing beyond; to the east by Associated Road and low density residential developments; to the south by Imperial Highway (SR-90) and City of Fullerton beyond; and to the west by the remaining portions of Brea Plaza Shopping Center and State Route 57 (SR-57) beyond. Access to the site is currently obtained via SR-90 to the south and Associated Road to the east. The project site is shown on the Location Map as Exhibit A.

The southern portion of the existing redevelopment site is occupied by two (2) building structures (a bank and a retail shop) and parking areas. The remainder of the site includes more parking areas, miscellaneous landscaping, a paved entrance at the eastern site limit and existing Loftus Channel. There are no natural or open areas within the site.

Geologically, the site is located within the Peninsular Ranges Geomorphic Province. The province is characterized by northwest trending valleys and mountains that, in part, owe their existence to regional northwest trending geologic structures. The site resides at the southeastern end of the Los Angeles basin, which is bound to the east by the Puente Hills and on the south by San Joaquin Hills, and is within a broad alluvial plain that is underlain by recent alluvium from Carbon Canyon that has been deposited on Quaternary Terrace deposits. Soils beneath the site include artificial fill, alluvium and quaternary terrace deposits. Onsite soil is generally categorized as HSG Soil Type “D”, which consists chiefly of clays, have high runoff and swelling potential, very slow infiltration and water transmission rates (<0.2”/hr). This is consistent with the findings of the site’s preliminary geotechnical investigation.[1]

The existing site has a runoff coefficient of 0.83 and approximately 90% impervious surface (does not include Loftus Channel). Runoff from the northern portion of the site is conveyed as sheet flow to existing gutters prior to discharging easterly to the Loftus Diversion Channel. Runoff from the central portion of the site is conveyed southerly and easterly as sheet flow to existing gutters prior to discharging to an existing catch basin and conveyed east to the Loftus Channel. Runoff from the southern portion of the site is conveyed easterly and southerly as sheet to an existing catch basin and discharged to the Loftus Channel. The project site also receives some run-on from areas of the shopping center located west of the proposed site.

In the developed condition, the site runoff coefficient will remain unchanged at approximately 0.83 and approximately 90% impervious surface. Runoff from the northern portion of the site will be conveyed to proposed catch basins in the northeastern portion of the site prior to discharging to the Loftus Channel. First flush runoff will be conveyed to proposed catch basins at the north end of the project that contain Kristar FloGard+PLUS insert filers. Low flow runoff will be conveyed via a low flow storm drain line to proposed vegetated swales (Swale Nos. 3 & 4) located just west of Associated Road.Bio Clean.

All runoff from the central portion of the site located west of Associated Road entrance will be conveyed southerly to a proposed catch basin located in the southern portion of the site prior to discharging to the Loftus Channel. Runoff from Associated Road entrance will be conveyed easterly to catch basins. First flush runoff will go through the onsite private catch basins that have Kristar FloGard+PLUS insert filters installed and low flow runoff will be conveyed to a vegetated swale (Swale No. 2) and then to an inlet with a Katchall insert for treatment prior to discharging to Loftus Channel.

[1] Pacific Soils Engineering, Inc (PSE, Inc.). February 18, 2008. “Preliminary Geotechnical Investigation – Proposed Storm Drain Improvements for the Loftus Diversion Channel and the Brea Shopping Center”.

Runoff from the remaining portion of the site (southern areas) will be conveyed easterly and northerly to proposed catch basins prior to discharging to the Loftus Channel. Water quality flows will be diverted and conveyed to a vegetated swale (Swale No. 1) for treatment prior to discharging offsite.

The project site does not contain any Areas of Special Biological Significance (ASBS) as identified by the State Water Resource Control Board (http://www.swrcb.ca.gov/water_issues/programs/ocean/asbs.shtml) or Environmentally Sensitive Areas (ESAs) as identified in by the County of Orange Watershed & Coastal Resources Division.

Improvements to existing Loftus Diversion Channel (Orange County Flood Control District Facility No. A06) will also require issuance of a permit by the U.S. Army Corps of Engineers ("ACOE"), pursuant to Section 404 of the federal Clean Water Act, since a portion of the channel bottom meets the criteria of a non-wetland Water of the U.S. A Streambed Alteration Agreement with the California Department of Fish and Game (CDFG) is required, due to removal of disturbed riparian vegetation in the channel area. County, ACOE and CDFG approvals have been met and copies of each permit and certification are attached in Appendix "C"

Watershed Area

This project is located within the jurisdiction of the Santa Ana Regional Water Quality Control Board (RWQCB – Region 8) and the San Gabriel River/Coyote Creek Watershed (Watershed "A"). The project discharges to Loftus Diversion Channel (Orange County Flood Control District Facility No. A06) and is tributary to Fullerton Creek (OCFCD Facility No. A03).

The Loftus Diversion Channel is an engineered OCFCD open channel facility, with revetted side slopes and an earthen bottom. The channel reach begins roughly 0.5 miles east of Kraemer Boulevard, between Birch Street and Imperial Highway. It runs westerly through the Birch Hills Golf Course prior to traveling southwesterly as it crosses beneath Associated Road. The channel then parallels Associated Road until it crosses beneath Imperial Highway, where it discharges to a debris basin between Imperial Highway and SR-57. The channel continues southwesterly and crosses beneath SR-57 and drains into the United States Army Corps of Engineers (USACOE) Fullerton Creek Reservoir at Craig Regional Park. Any overflow from this area is discharged to Fullerton Creek, located approximately 0.5 miles southwest of the park. Runoff is then conveyed approximately 10 miles in a westerly (southwesterly) direction to Coyote Creek (OCFCD Facility No. A01). Coyote Creek confluences with San Gabriel River approximately six (6) miles to the south prior to discharging to the Pacific Ocean (approximately 4 miles south of confluence).

Although the proposed project does not discharge directly into an impaired water body, runoff from the site is tributary to Coyote Creek and San Gabriel River, which are both considered impaired under Section 303(d) of the Clean Water Act. Coyote Creek is currently listed as impaired for Coliform Bacteria, Dissolved Copper, Diazinon, Lead, pH, Toxicity and Zinc. San Gabriel River downstream of the project site is currently listed as impaired for Copper and Coliform Bacteria, with established Total Maximum Daily Load (TMDL) requirements for Metals and Selenium.

Based on the project's expected pollutants concern and receiving water body impairments, the project's primary pollutants of concern are bacteria and metals. Other pollutants of concern for the site include organic compounds, trash and debris, oxygen demanding substances, oil and grease, nutrients, pesticides and sediment.

Hydrologic Conditions of Concern

Hydrologic conditions of concern for any development such as the proposed project, may include potential water quality degradation; increased runoff volume and velocity; reduced infiltration; increased flow frequency, duration and peaks; and faster time to reach peak flow resulting from development.

Runoff from the project site will discharge to Loftus Diversion Channel located west of Associated Road. As part of this project, the portion of the channel north of Imperial Highway and adjacent to the site will be fully improved to ensure that it is capable of accepting all upstream flow, in addition to any flow increase from the proposed parking lot areas, landscaping and other improvements to be constructed over the channel.

With the proposed improvements to the channel, project development would not cause any hydrologic conditions of concern. All discharge shall be in full compliance with Co-Permittee requirements for connections and discharges to the MS4 (including both quality and quantity requirements) and the discharge would not significantly impact stream habitat in proximate Receiving Waters.

IV. Best Management Practices

BMPs are structural devices, procedures, rules or methods which, when implemented and followed, should reduce and/or eliminate the specific source of pollution of which the BMP is targeted. This section, describes in the following how each of these BMPs will be implemented for the proposed project. For those routine BMPs that are not applicable to this project, an explanation is included as to why that is the case. All BMPs indicated in this WQMP should be maintained in good and effective condition.

All improvements within the project site will be private improvements, to be owned and maintained by Bosc Equities. The contact person for the site is Mr. Marc Harris, Bosc Equities, 413 S. Associated Road, Brea, CA 92821, (714) 990-5715.

By means of lease agreements, the owner shall establish requirements for (a) community common areas in the project and (b) implementation of community pollution prevention on BMPs, including community awareness programs.

Routine Source Control BMPs are required to be incorporated in all new development redevelopment projects unless not applicable. In the tables provided, all BMPs to be incorporated in the project are indicated. For those designated as not applicable, a brief reason why is stated. All source control BMPs shall be maintained by the Owner.

All source control BMPs listed for specific land use/type of project in the following Countywide Water Quality Management Plan tables have been discussed and considered for utilization to the extent that they are appropriate for the site and project. For a BMP listed in the table following not used for the project, this section of the WQMP has explained why this source control BMP is not appropriate for the project.

IV.1 Site Design BMPs

The following table shows site design BMPs that are included in this project. A brief description of each BMP also follows:

TABLE 1. SITE DESIGN BMPS

Technique	Included?		If no, state justification.
	Yes	No	
Minimize Directly Connected Impervious Areas (DCIAs) (C-Factor Reduction)	X		
Create Reduced or "Zero Discharge" Areas (Runoff Volume Reduction)[1]		X	Site consists of Type "D" soils, which would create saturation and other drainage issues.
Minimize Impervious Area/Maximize Permeability (C-Factor Reduction)[2]	X		
Conserve Natural Areas (C-Factor Reduction)		X	No existing natural areas located within site.

1 Detention and retention areas incorporated into landscape design provide areas for retaining and detaining stormwater flows, resulting in lower runoff rates and reductions in volume due to limited infiltration and evaporation. Such Site Design BMPs may reduce the size of Treatment Control BMPs.

2 The "C Factor" is a representation of the ability of a surface to produce runoff. Surfaces that produce higher volumes of runoff are represented by higher C Factors. By incorporating more pervious, lower C Factor surfaces into a development, lower volumes of runoff will be produced. Lower volumes and rates of runoff translate directly to lowering treatment requirements.

Minimize Directly Connected Impervious Areas

The project has been designed to include the following concepts to reduce the amount of directly connected impervious areas and reduce the project's C-factor:

1. Drain rooftops to adjacent landscaping prior to discharging to the storm drain system.
2. Drain sidewalks to adjacent landscaping.
3. Use of vegetated swales to convey low flow runoff as well as the first flush runoff.
4. Incorporate landscaping throughout the site to reduce directly connected impervious areas.

Create Reduced or "Zero Discharge" Areas

Since onsite soil consists entirely of HSG Group "D" soils with very poor infiltration rates, the project does not propose the use of zero discharge areas, such as infiltration, bioretention and rain garden areas. Employment of these BMPs in unsuitable soils may lead to standing water and saturation of soil and other drainage related problems.

Minimize Impervious Area/Maximize Permeability

The following concepts have been incorporated into project designs to minimize impervious area and maximize pervious areas:

1. Use of minimum parking aisle widths while still remaining in compliance with City of Brea Fire Services Department.
2. Maximize canopy interception of rain by providing native and/or drought tolerant tree species within parking lot areas and landscaping areas (eastern portion of site).
3. Construct sidewalks and walkways to minimum width, as required the ADA and County requirements.
4. Minimize the use of decorative concrete within the common areas of the site by minimizing the use of hardscape and paved landscaping edges/borders, allowing runoff to be filtered through landscape areas prior to entering the storm drain system.

Conserve Natural Areas

Since the existing site is currently a shopping center, there are no natural areas. All existing landscaping will be removed and replaced with new landscaping.

IV.2 Source Control BMPs

The following tables show source control BMPs (routine non-structural and routine structural) included in this project and those that were not included.

IV.2.1 Routine Non-Structural BMPs

TABLE 2. ROUTINE NON-STRUCTURAL BMPS

BMP No.	Name	Check One		If not applicable, state brief reason.
		Included	Not Applicable	
N1	Education for Property Owners, Tenants and Occupants	X		
N2	Activity Restriction	X		
N3	Common Area Landscape Management	X		
N4	BMP Maintenance	X		
N5	Title 22 CCR Compliance		X	Applies to commercial/industrial projects that use or generate hazardous materials.
N6	Local Water Quality Permit Compliance		X	The City does not issue water quality permits.
N7	Spill Contingency Plan		X	Applies to commercial/industrial projects that use or generate hazardous materials.
N8	Underground Storage Tank Compliance		X	None proposed.
N9	Hazardous Materials Disclosure Compliance		X	No storage or use of hazardous materials requiring disclosure.
N10	Uniform Fire Code Implementation		X	Site does not store, use or generate materials regulated under UFC.
N11	Common Area Litter Control	X		
N12	Employee Training	X		
N13	Housekeeping of Loading Docks		X	No loading docks proposed for site.
N14	Common Area Catch Basin Inspection	X		
N15	Street Sweeping Private Streets and Parking Lots	X		
N17**	Retail Gasoline Outlets		X	No gasoline stations proposed.

** There is no BMP with the designation N16.

1. Tenant Education (N1)

The Site Owner will insure that all tenants will be given a copy of the lease agreement, which will contain a section outlining the environmental awareness education materials. The POA shall establish requirements for the implementation of a community awareness program that informs tenants of the impacts of dumping oil, paints, solvents or other potentially harmful chemicals into the storm drain; and the impacts of littering. Environmental awareness education materials, including, but not limited to those included in Section VII of this WQMP, shall be provided to all tenants after acceptance of lease terms and periodically thereafter.

2. Activity Restrictions (N2)

Within the lease agreements to be prepared, language shall be included to identify surface water quality protection required by the Owner and tenants. These may include distribution of environmental awareness materials to tenants, restrictions on onsite vehicle maintenance, vehicle washings and litter control. Surface water quality activities shall also be conducted in conformance with the Water Quality Management Plan as it relates to the handling and disposal of contaminants.

3. Common Area Landscape Management (N3)

Management programs will be designed and established by the Owner, which will maintain all common areas within the project site. These programs will include how to mitigate the potential dangers of fertilizer and pesticide usage. Ongoing maintenance will be consistent with the County Water Conservation Resolution (Ordinance. No. 3802) and the State of California Model Water-Efficient Landscape Ordinance. Fertilizer and Pesticide usage shall be consistent with County Management Guidelines for use of Fertilizers and Pesticides.

4. BMP Maintenance (N4)

The Owner shall be responsible for implementation of each applicable non-structural, structural and treatment BMP as well as scheduling inspection and maintenance cleaning of all applicable structural BMP facilities. The Owner shall be responsible for inspection and maintenance activities in landscape areas (see Section VI, Site Plan). Debris and other water pollutants will be controlled, contained and disposed of in a proper manner by the apartment management. Section V refers.

5. Common Area Litter Control (N11)

The Owner shall be required to maintain weekly sweeping and trash pick-up within the project areas and landscape areas. This will be achieved through the use of site maintenance staff or a maintenance contractor. Trash areas and receptacles will be inspected daily to make sure lids are closed, that surrounding areas are trash-free and that full receptacles are regularly emptied. Pursuant to Section V, responsibility shall include the emptying of trash receptacles, noting of disposal violations by tenants, and reporting such violations to the Owner for investigation.

6. Employee Training (N12)

Post construction, an employee training/education program will be established as it would apply to future employees, contractors of the Owner and tenants, to inform and train employees engaged in maintenance activities regarding the impact of dumping oil, paints, solvents or other potentially harmful chemicals into storm drain; the proper use of fertilizers and pesticides in landscaping maintenance practices; and the impacts of littering and improper water disposal.

7. Common Area Catch Basin Inspection (N14)

Post construction, the project's onsite storm drain system and catch basins will be maintained by the Owner. These activities will be done on a regular basis, and prior to the storm season, no later than October 1st of each year.

8. Street Sweeping Private Streets and Parking Lots (N15)

The Owner shall be responsible for ensuring that all parking aisles, lots and access ways are vacuum swept on a weekly basis. This procedure may be intensified around October 1st of each year prior to the "first flush" storm if needed.

9. Building Maintenance (IC-3)

As part of the project's ongoing maintenance program, the Owner's maintenance personnel shall properly collect and dispose of water when washing buildings, rooftops and other large objects. Work areas shall be prepared before conducting building maintenance and all materials generated and used shall be properly disposed.

10. Outdoor Loading and Unloading of Materials (IC-10)

The project does not include a "dock area" as typically found at commercial or industrial sites. Loading of materials will be conducted from the proposed parking lot in the shopping center. This area shall be kept clean at all times, and inspected daily for trash, litter and debris. All spills will be cleaned up immediately. Sweeping shall be preferred to wash down. In the event wash water is used for the loading/delivery area, all water shall be contained and not discharged into the storm drain system, but disposed of properly.

11. Parking and Storage Area Maintenance (IC-15)

All project parking areas shall be vacuum swept on a weekly basis and as necessary. All wash water shall be properly contained, collected and disposed. Parking lot shall be kept in a clean and orderly state. Use of absorbent materials to clean up vehicle related spills and leaks shall be disposed of properly. Inspections of the parking lot shall be conducted on a weekly basis, at minimum, by the Owner's site maintenance personnel.

IV.2.2 Routine Structural BMPs

Structural BMPs shall be installed initially by the contractor through the construction and development of the project. For instance, landscaping and irrigation systems shall be designed by licensed landscape architects and installed by qualified contractors to City standards and specifications. Structural BMPs used for this project are summarized in the Operation and Maintenance Plan, located in Section V.

TABLE 3. ROUTINE STRUCTURAL BMPS

Name	Check One		If not applicable, state brief reason
	Included	Not Applicable	
Provide storm drain system stenciling and signage	X		
Design and construct outdoor material storage areas to reduce pollution introduction		X	No outdoor storage of materials permitted onsite.
Design and construct trash and waste storage areas to reduce pollution introduction	X		
Use efficient irrigation systems & landscape design	X		
Protect slopes and channels and provide energy dissipation	X		
Incorporate requirements applicable to individual project features	X		
a. Dock areas		X	No designated loading dock areas proposed.
b. Maintenance bays		X	No maintenance bays proposed.
c. Vehicle wash areas		X	No vehicle wash areas proposed.
d. Outdoor processing areas		X	No outdoor processing of materials allowed onsite.
e. Equipment wash areas		X	No equipment wash areas proposed for shopping center.
f. Fueling areas		X	No fueling areas proposed.
g. Hillside landscaping		X	Project site is flat.
h. Wash water control for food preparation areas	X		
i. Community car wash racks		X	Project is not residential.

1. Common Area Runoff – Site Design and Landscape Planning (SD-10)

As a part of the design of all common area landscape areas, similar planting material with similar water requirements will be used in order to reduce excess irrigation runoff and promote surface filtration. Additionally, such vegetation will consist of native drought-tolerant species and/or approved non-invasive vegetation, as directed by the project's landscape architect. Such common areas will be maintained by the Owner through its landscape maintenance contractor.

2. Common Area Efficient Irrigation (SD-12)

As a part of the design of all common area landscape irrigation, implementation of the Orange County Water Conservation Resolution (Ord. No. 3802) including, but not limited to, such provisions as water sensors, programmable irrigation times (for short cycles), etc., will be used. Such common areas will be maintained by the Owner's landscape maintenance contractor.

3. Storm Drain System Signs (SD-13)

As a part of the final civil engineering drawings, it will be required by the Developer to stencil on all of the project's catch basins, where applicable in paved areas, the words, "No Dumping - Drains to Ocean." This will be done in a location that can be clearly seen by all and will be routinely inspected and re-stenciled, as necessary for legibility.

4. Slope Protection and Energy Dissipation

Energy dissipation shall be provided as part of improvements to the Loftus Diversion Channel. These devices include the construction of rip-rap. Upon completion, responsibilities pertaining to the improved channel will be turned over to the County of Orange (OCFCD).

5. Trash Storage Areas (SD-32, IC-21)

All trash enclosures shall be paved with an impervious surface, with area enclosed to prevent offsite transport of trash, storm water run-on and discharge of nuisance runoff. The dumpster shall be leak proof and covered at all times. Connection of any drainage system within the enclosure areas to the storm drain is prohibited. Drainage from trash areas may be connected to the sanitary sewer with proper authorization. Trash will be removed on a weekly basis or as required. In addition, these areas will be inspected on a daily basis for debris and overfill.

6. Wash Water controls for Food Preparation Areas (IC-22)

Restaurants and food-preparation areas will not employ garbage disposals and will discourage the disposal of food wastes to the sanitary sewer system. The restaurant in Building A-2 will have a grease interceptor to help minimize the effects of Food, Oils and Grease (FOG) on the sanitary sewer. Food Preparation areas will additionally follow BMP guidelines specified in IC-22 Eating and Drinking Establishments.

IV.3 Treatment Control BMPs

This project is designated as a Priority Project. Therefore, treatment control BMPs are required to remove pollutants typically associated with urban runoff. The following table shows treatment BMPs that are included in this project. A brief description of each BMP also follows. For BMPs not selected for use onsite, a brief explanation has been provided at the end of this section

TABLE 4. TREATMENT CONTROL BMPS

Name	Included?		If not applicable, state brief reason
	Yes	No	
Vegetated (Grass) Strips		X	Swales, Kristar and Bio Clean outlet filter proposed to treat project runoff.
Vegetated (Grass) Swales	X		
Dry Detention Basin		X	Considered but not employed due to size constraints.
Wet Detention Basin		X	Considered but not incorporated due to size constraints and potential vector issues.
Constructed Wetland		X	Considered but not incorporated due to size constraints and potential vector issues.
Detention Basin/Sand Filter		X	Considered but not employed due to size constraints.
Porous Pavement Detention		X	Site contains Type “D” soils which aren’t recommended for porous pavement.
Porous Landscape Detention		X	Potential for saturation of foundations due to soil type.
Infiltration Basin		X	Project soil type not suitable for infiltration BMPs.
Infiltration Trench		X	Project soil type not suitable for infiltration BMPs.
Media Filter		X	Swales. Kristar and Bio Clean outlet filter proposed to treat project runoff.
Proprietary Control Measures	X		.

Treatment Train: Vegetated Swale (TC-30) with Bio Clean Drain Inserts and Kristar FloGard+PLUS

First Flush runoff will be conveyed easterly to one of the Kristar FloGard+PLUS insert filters. The low flow runoff from the project site will be conveyed easterly to one of four proposed vegetated swales located in the eastern portion of the site. Runoff will be conveyed to the swales via low flow pipes or parkway culverts. The locations of the Kristar Insert filters and swales are provided in the WQMP Water Quality Exhibit.

The insert filters are to be installed per the instructions given by Kristar (located as an attachment). The Kristar FloGard+PLUS insert filters are used to capture sediment, debris, trash & oil or grease from first flush runoff. The devices can retain sediment and floatables under extreme weather conditions and are designed to fit most industry standard drainage inlets.

The swales will be constructed in accordance with the design requirements of CASQA TC-30 to ensure that the swale is functional and effective in treating first flush and low flow runoff. The vegetated swale system will treat runoff through the filtering characteristic of the vegetation on the surface of the swale as well some infiltration. The swales will be capable of trapping particulate pollutants (suspended solids and trace metals), promote infiltration and reduce the flow velocity of storm water runoff. A minimum hydraulic residence time of 10 minutes for the analyzed flow rate (SQDF) is required by design guidelines through the vegetated swale.

Based on preliminary designs, the SQDF and other design information for each swale have been determined and are provided in the following table:

Swale Designation	Drainage Area (Ac)	SQDF (cfs)	Length (ft)	Bottom Width (ft)	Side Slopes (ft)
1	2.33	0.39	84	7	4
2	9.34	1.55	156	8.5	4 (L) & 2 (R)
3	1.89	0.31	102	5	4
4	0.13	0.02	36	5	4

The project will also incorporate three auxiliary swales in the northerly portion of the project adjacent to Swale No. 3. These swales are not designed to the water quality requirements of TC-30 or the County DAMP, however drain to inlets with Bio Clean inserts prior to discharging to either Swale Nos. 3 or 4 or to the Loftus Channel.

Bacteria, as a pollutant of concern, will be addressed through the use of Bio Clean basin inserts, at the swale's outlets to Loftus Channel (OCFCD A06). Test results claim that their antimicrobial filtration products produce a "reduction of 99.4% of all bacteria, viruses, algae, mold, mildew and yeast colonies upon contact; with unobstructed flow-rates of > 180 GPM per square foot." For further product information see the published data provided in Section V.

BMP Selection Determination

Many factors were taken into consideration in selecting the proposed BMPs. These include anticipated pollutants, existing and proposed site conditions (such as grade constraints), feasibility of employment (feasibility of routing runoff to proposed BMP), ease of integrating the BMP into the overall land plan, visual aesthetics, public safety, ease of maintenance, as well as overall treatment effectiveness. BMP selection for the project primarily focused on the use of natural systems, such as swales

BMPs requiring large footprints that are not easily integrated into the site design, such as basins (dry and infiltration basins), ponds and wetlands, were considered but not employed due to type of redevelopment (commercial shopping center), the large footprint required and their potential as breeding areas for vectors. These BMPs would be more suited for low density residential developments.

Other BMPs, such as porous pavement, porous landscape areas and infiltration BMPs, were considered but not employed due to project soil type (Type "D", consisting mainly of clay soils, with infiltration rate < 0.2"/hr). Although pollutant removal through cation exchange is beneficial from clay particles, soils with more than 30% clay composition is generally not recommended for infiltration BMPs. The slow infiltration rate of these soils creates great potential for saturating underlying soil and structural foundations. Additionally, the expansion potential of wet clay is also a cause of concern when employing infiltration BMPs. Based on the findings from the site's preliminary geotechnical investigation conducted by Pacific Soils Engineering, Inc., infiltration BMPs were not proposed.

Based on aforementioned constraints, vegetated swales have been determined to be the most feasible treatment alternative.

TC30 VEGETATED SWALE

VEGETATED SWALE CALCULATIONS

Vegetated Swale TC-30

Design Considerations

- Tributary Area
- Area Required
- Slope
- Water Availability

Description

Vegetated swales are open, shallow channels with vegetation covering the side slopes and bottom that collect and slowly convey runoff flow to downstream discharge points. They are designed to treat runoff through filtering by the vegetation in the channel, filtering through a subsoil matrix, and/or infiltration into the underlying soils. Swales can be natural or manmade. They trap particulate pollutants (suspended solids and trace metals), promote infiltration, and reduce the flow velocity of stormwater runoff. Vegetated swales can serve as part of a stormwater drainage system and can replace curbs, gutters and storm sewer systems.

California Experience

Caltrans constructed and monitored six vegetated swales in southern California. These swales were generally effective in reducing the volume and mass of pollutants in runoff. Even in the areas where the annual rainfall was only about 10 inches/yr, the vegetation did not require additional irrigation. One factor that strongly affected performance was the presence of large numbers of gophers at most of the sites. The gophers created earthen mounds, destroyed vegetation, and generally reduced the effectiveness of the controls for TSS reduction.

Advantages

- If properly designed, vegetated, and operated, swales can serve as an aesthetic, potentially inexpensive urban development or roadway drainage conveyance measure with significant collateral water quality benefits.

CASQA California Stormwater Quality Association

- Roadside ditches should be regarded as significant potential swale/buffer strip sites and should be utilized for this purpose whenever possible.

Limitations

- Can be difficult to avoid channelization.
- May not be appropriate for industrial sites or locations where spills may occur
- Grassed swales cannot treat a very large drainage area. Large areas may be divided and treated using multiple swales.
- A thick vegetative cover is needed for these practices to function properly.
- They are impractical in areas with steep topography.
- They are not effective and may even erode when flow velocities are high, if the grass cover is not properly maintained.
- In some places, their use is restricted by law: many local municipalities require curb and gutter systems in residential areas.
- Swales are mores susceptible to failure if not properly maintained than other treatment BMPs.

Design and Sizing Guidelines

- Flow rate based design determined by local requirements or sized so that 85% of the annual runoff volume is discharged at less than the design rainfall intensity.
- Swale should be designed so that the water level does not exceed 2/3rds the height of the grass or 4 inches, which ever is less, at the design treatment rate.
- Longitudinal slopes should not exceed 2.5%
- Trapezoidal channels are normally recommended but other configurations, such as parabolic, can also provide substantial water quality improvement and may be easier to mow than designs with sharp breaks in slope.
- Swales constructed in cut are preferred, or in fill areas that are far enough from an adjacent slope to minimize the potential for gopher damage. Do not use side slopes constructed of fill, which are prone to structural damage by gophers and other burrowing animals.
- A diverse selection of low growing, plants that thrive under the specific site, climatic, and watering conditions should be specified. Vegetation whose growing season corresponds to the wet season are preferred. Drought tolerant vegetation should be considered especially for swales that are not part of a regularly irrigated landscaped area.
- The width of the swale should be determined using Manning's Equation using a value of 0.25 for Manning's n.

Construction/Inspection Considerations

- Include directions in the specifications for use of appropriate fertilizer and soil amendments based on soil properties determined through testing and compared to the needs of the vegetation requirements.
- Install swales at the time of the year when there is a reasonable chance of successful establishment without irrigation; however, it is recognized that rainfall in a given year may not be sufficient and temporary irrigation may be used.
- If sod tiles must be used, they should be placed so that there are no gaps between the tiles; stagger the ends of the tiles to prevent the formation of channels along the swale or strip.
- Use a roller on the sod to ensure that no air pockets form between the sod and the soil.
- Where seeds are used, erosion controls will be necessary to protect seeds for at least 75 days after the first rainfall of the season.

Performance

The literature suggests that vegetated swales represent a practical and potentially effective technique for controlling urban runoff quality. While limited quantitative performance data exists for vegetated swales, it is known that check dams, slight slopes, permeable soils, dense grass cover, increased contact time, and small storm events all contribute to successful pollutant removal by the swale system. Factors decreasing the effectiveness of swales include compacted soils, short runoff contact time, large storm events, frozen ground, short grass heights, steep slopes, and high runoff velocities and discharge rates.

Conventional vegetated swale designs have achieved mixed results in removing particulate pollutants. A study performed by the Nationwide Urban Runoff Program (NURP) monitored three grass swales in the Washington, D.C., area and found no significant improvement in urban runoff quality for the pollutants analyzed. However, the weak performance of these swales was attributed to the high flow velocities in the swales, soil compaction, steep slopes, and short grass height.

Another project in Durham, NC, monitored the performance of a carefully designed artificial swale that received runoff from a commercial parking lot. The project tracked 11 storms and concluded that particulate concentrations of heavy metals (Cu, Pb, Zn, and Cd) were reduced by approximately 50 percent. However, the swale proved largely ineffective for removing soluble nutrients.

The effectiveness of vegetated swales can be enhanced by adding check dams at approximately 17 meter (50 foot) increments along their length (See Figure 1). These dams maximize the retention time within the swale, decrease flow velocities, and promote particulate settling. Finally, the incorporation of vegetated filter strips parallel to the top of the channel banks can help to treat sheet flows entering the swale.

Only 9 studies have been conducted on all grassed channels designed for water quality (Table 1). The data suggest relatively high removal rates for some pollutants, but negative removals for some bacteria, and fair performance for phosphorus.

Table 1 Grassed swale pollutant removal efficiency data							
	Removal Efficiencies (% Removal)						
Study	TSS	TP	TN	NO_3	Metals	Bacteria	Type
Caltrans 2002	77	8	67	66	83-90	-33	dry swales
Goldberg 1993	67.8	4.5	-	31.4	42–62	-100	grassed channel
Seattle Metro and Washington Department of Ecology 1992	60	45	-	-25	2–16	-25	grassed channel
Seattle Metro and Washington Department of Ecology, 1992	83	29	-	-25	46–73	-25	grassed channel
Wang et al., 1981	80	-	-	-	70–80	-	dry swale
Dorman et al., 1989	98	18	-	45	37–81	-	dry swale
Harper, 1988	87	83	84	80	88–90	-	dry swale
Kercher et al., 1983	99	99	99	99	99	-	dry swale
Harper, 1988.	81	17	40	52	37–69	-	wet swale
Koon, 1995	67	39	-	9	-35 to 6	-	wet swale

While it is difficult to distinguish between different designs based on the small amount of available data, grassed channels generally have poorer removal rates than wet and dry swales, although some swales appear to export soluble phosphorus (Harper, 1988; Koon, 1995). It is not clear why swales export bacteria. One explanation is that bacteria thrive in the warm swale soils.

Siting Criteria

The suitability of a swale at a site will depend on land use, size of the area serviced, soil type, slope, imperviousness of the contributing watershed, and dimensions and slope of the swale system (Schueler et al., 1992). In general, swales can be used to serve areas of less than 10 acres, with slopes no greater than 5 %. Use of natural topographic lows is encouraged and natural drainage courses should be regarded as significant local resources to be kept in use (Young et al., 1996).

Selection Criteria (NCTCOG, 1993)

- Comparable performance to wet basins
- Limited to treating a few acres
- Availability of water during dry periods to maintain vegetation
- Sufficient available land area

Research in the Austin area indicates that vegetated controls are effective at removing pollutants even when dormant. Therefore, irrigation is not required to maintain growth during dry periods, but may be necessary only to prevent the vegetation from dying.

The topography of the site should permit the design of a channel with appropriate slope and cross-sectional area. Site topography may also dictate a need for additional structural controls. Recommendations for longitudinal slopes range between 2 and 6 percent. Flatter slopes can be used, if sufficient to provide adequate conveyance. Steep slopes increase flow velocity, decrease detention time, and may require energy dissipating and grade check. Steep slopes also can be managed using a series of check dams to terrace the swale and reduce the slope to within acceptable limits. The use of check dams with swales also promotes infiltration.

Additional Design Guidelines

Most of the design guidelines adopted for swale design specify a minimum hydraulic residence time of 9 minutes. This criterion is based on the results of a single study conducted in Seattle, Washington (Seattle Metro and Washington Department of Ecology, 1992), and is not well supported. Analysis of the data collected in that study indicates that pollutant removal at a residence time of 5 minutes was not significantly different, although there is more variability in that data. Therefore, additional research in the design criteria for swales is needed. Substantial pollutant removal has also been observed for vegetated controls designed solely for conveyance (Barrett et al, 1998); consequently, some flexibility in the design is warranted.

Many design guidelines recommend that grass be frequently mowed to maintain dense coverage near the ground surface. Recent research (Colwell et al., 2000) has shown mowing frequency or grass height has little or no effect on pollutant removal.

Summary of Design Recommendations

1) The swale should have a length that provides a minimum hydraulic residence time of at least 10 minutes. The maximum bottom width should not exceed 10 feet unless a dividing berm is provided. The depth of flow should not exceed 2/3rds the height of the grass at the peak of the water quality design storm intensity. The channel slope should not exceed 2.5%.

2) A design grass height of 6 inches is recommended.

3) Regardless of the recommended detention time, the swale should be not less than 100 feet in length.

4) The width of the swale should be determined using Manning's Equation, at the peak of the design storm, using a Manning's n of 0.25.

5) The swale can be sized as both a treatment facility for the design storm and as a conveyance system to pass the peak hydraulic flows of the 100-year storm if it is located "on-line." The side slopes should be no steeper than 3:1 (H:V).

6) Roadside ditches should be regarded as significant potential swale/buffer strip sites and should be utilized for this purpose whenever possible. If flow is to be introduced through curb cuts, place pavement slightly above the elevation of the vegetated areas. Curb cuts should be at least 12 inches wide to prevent clogging.

7) Swales must be vegetated in order to provide adequate treatment of runoff. It is important to maximize water contact with vegetation and the soil surface. For general purposes, select fine, close-growing, water-resistant grasses. If possible, divert runoff (other than necessary irrigation) during the period of vegetation

establishment. Where runoff diversion is not possible, cover graded and seeded areas with suitable erosion control materials.

Maintenance

The useful life of a vegetated swale system is directly proportional to its maintenance frequency. If properly designed and regularly maintained, vegetated swales can last indefinitely. The maintenance objectives for vegetated swale systems include keeping up the hydraulic and removal efficiency of the channel and maintaining a dense, healthy grass cover.

Maintenance activities should include periodic mowing (with grass never cut shorter than the design flow depth), weed control, watering during drought conditions, reseeding of bare areas, and clearing of debris and blockages. Cuttings should be removed from the channel and disposed in a local composting facility. Accumulated sediment should also be removed manually to avoid concentrated flows in the swale. The application of fertilizers and pesticides should be minimal.

Another aspect of a good maintenance plan is repairing damaged areas within a channel. For example, if the channel develops ruts or holes, it should be repaired utilizing a suitable soil that is properly tamped and seeded. The grass cover should be thick; if it is not, reseed as necessary. Any standing water removed during the maintenance operation must be disposed to a sanitary sewer at an approved discharge location. Residuals (e.g., silt, grass cuttings) must be disposed in accordance with local or State requirements. Maintenance of grassed swales mostly involves maintenance of the grass or wetland plant cover. Typical maintenance activities are summarized below:

- Inspect swales at least twice annually for erosion, damage to vegetation, and sediment and debris accumulation preferably at the end of the wet season to schedule summer maintenance and before major fall runoff to be sure the swale is ready for winter. However, additional inspection after periods of heavy runoff is desirable. The swale should be checked for debris and litter, and areas of sediment accumulation.
- Grass height and mowing frequency may not have a large impact on pollutant removal. Consequently, mowing may only be necessary once or twice a year for safety or aesthetics or to suppress weeds and woody vegetation.
- Trash tends to accumulate in swale areas, particularly along highways. The need for litter removal is determined through periodic inspection, but litter should always be removed prior to mowing.
- Sediment accumulating near culverts and in channels should be removed when it builds up to 75 mm (3 in.) at any spot, or covers vegetation.
- Regularly inspect swales for pools of standing water. Swales can become a nuisance due to mosquito breeding in standing water if obstructions develop (e.g. debris accumulation, invasive vegetation) and/or if proper drainage slopes are not implemented and maintained.

Cost

Construction Cost

Little data is available to estimate the difference in cost between various swale designs. One study (SWRPC, 1991) estimated the construction cost of grassed channels at approximately $0.25 per ft². This price does not include design costs or contingencies. Brown and Schueler (1997) estimate these costs at approximately 32 percent of construction costs for most stormwater management practices. For swales, however, these costs would probably be significantly higher since the construction costs are so low compared with other practices. A more realistic estimate would be a total cost of approximately $0.50 per ft², which compares favorably with other stormwater management practices.

Table 2 Swale Cost Estimate (SEWRPC, 1991)

Component	Unit	Extent	Unit Cost			Total Cost		
			Low	Moderate	High	Low	Moderate	High
Mobilization / Demobilization-Light	Swale	1	$107	$274	$441	$107	$274	$441
Site Preparation								
Clearing[b]	Acre	0.5	$2,200	$3,800	$5,400	$1,100	$1,900	$2,700
Grubbing[c]	Acre	0.25	$3,800	$5,200	$6,600	$950	$1,300	$1,650
General Excavation[d]	Yd[3]	372	$2.10	$3.70	$5.30	$781	$1,376	$1,972
Level and Till[e]	Yd[2]	1,210	$0.20	$0.35	$0.50	$242	$424	$605
Sites Development								
Salvaged Topsoil Seed, and Mulch[f]	Yd[2]	1,210	$0.40	$1.00	$1.60	$484	$1,210	$1,936
Sod[g]	Yd[2]	1,210	$1.20	$2.40	$3.60	$1,452	$2,904	$4,356
Subtotal	--	--	--	--	--	$5,116	$9,388	$13,660
Contingencies	Swale	1	25%	25%	25%	$1,279	$2,347	$3,415
Total	--	--	--	--	--	$6,395	$11,735	$17,075

Source: (SEWRPC, 1991)

Note: Mobilization/demobilization refers to the organization and planning involved in establishing a vegetative swale.

[a] Swale has a bottom width of 1.0 foot, a top width of 10 feet with 1:3 side slopes, and a 1,000-foot length.

[b] Area cleared = (top width + 10 feet) x swale length.

[c] Area grubbed = (top width x swale length).

[d] Volume excavated = (0.67 x top width x swale depth) x swale length (parabolic cross-section).

[e] Area tilled = $\left(\text{top width} + \frac{8(\text{swale depth}^2)}{3(\text{top width})}\right)$ x swale length (parabolic cross-section).

[f] Area seeded = area cleared x 0.5.

[g] Area sodded = area cleared x 0.5.

Table 3 Estimated Maintenance Costs (SEWRPC, 1991)

Component	Unit Cost	Swale Size (Depth and Top Width)		Comment
		1.5 Foot Depth, One-Foot Bottom Width, 10-Foot Top Width	3-Foot Depth, 3-Foot Bottom Width, 21-Foot Top Width	
Lawn Mowing	$0.85 / 1,000 ft²/ mowing	$0.14 / linear foot	$0.21 / linear foot	Lawn maintenance area=(top width + 10 feet) x length. Mow eight times per year
General Lawn Care	$9.00 / 1,000 ft²/ year	$0.18 / linear foot	$0.28 / linear foot	Lawn maintenance area = (top width + 10 feet) x length
Swale Debris and Utter Removal	$0.10 / linear foot / year	$0.10 / linear foot	$0.10 / linear foot	–
Grass Reseeding with Mulch and Fertilizer	$0.30 / yd²	$0.01 / linear foot	$0.01 / linear foot	Area revegetated equals 1% of lawn maintenance area per year
Program Administration and Swale Inspection	$0.15 / linear foot / year, plus $25 / inspection	$0.15 / linear foot	$0.15 / linear foot	Inspect four times per year
Total	--	**$0.58 / linear foot**	**$ 0.75 / linear foot**	–

Maintenance Cost

Caltrans (2002) estimated the expected annual maintenance cost for a swale with a tributary area of approximately 2 ha at approximately $2,700. Since almost all maintenance consists of mowing, the cost is fundamentally a function of the mowing frequency. Unit costs developed by SEWRPC are shown in Table 3. In many cases vegetated channels would be used to convey runoff and would require periodic mowing as well, so there may be little additional cost for the water quality component. Since essentially all the activities are related to vegetation management, no special training is required for maintenance personnel.

MP-52 DRAIN INSERTS

&

BIO CLEAN ANTIMICROBIAL TREATMENT BMP INFORMATION

&

KRISTAR FLOGARD+PLUS INSERT FILTERS

Drain Insert

MP-52

General Description

Drain inserts are manufactured filters or fabric placed in a drop inlet to remove sediment and debris. There are a multitude of inserts of various shapes and configurations, typically falling into one of three different groups: socks, boxes, and trays. The sock consists of a fabric, usually constructed of polypropylene. The fabric may be attached to a frame or the grate of the inlet holds the sock. Socks are meant for vertical (drop) inlets. Boxes are constructed of plastic or wire mesh. Typically a polypropylene "bag" is placed in the wire mesh box. The bag takes the form of the box. Most box products are one box; that is, the setting area and filtration through media occur in the same box. Some products consist of one or more trays or mesh grates. The trays may hold different types of media. Filtration media vary by manufacturer. Types include polypropylene, porous polymer, treated cellulose, and activated carbon.

Inspection/Maintenance Considerations

Washout problems increase with rain intensity. Susceptibility of accumulated sediments to be re-suspended at low flow rates, can be corrected with an energy dissipater between gate and treatment areas.

Inspection Activities	Suggested Frequency
■ Inspect for sediment buildup and proper functioning.	At the beginning of the wet season and after significant storms
■ Verify that stormwater enters the unit and does not leak around the perimeter.	After construction.
Maintenance Activities	**Suggested Frequency**
■ Remove sediment as needed.	At the beginning of the wet season and as necessary

Maintenance Concerns, Objectives, and Goals

■ Sediment Removal

Targeted Constituents

- ✓ Sediment
- ✓ Nutrients
- ✓ Trash
- ✓ Metals
- Bacteria
- ✓ Oil and Grease
- ✓ Organics

Removal Effectiveness

Subject: Brea Channel Filtration Project – Weir Wall Filtration Devices

Objective: Provide "Or Equal" Submittal for Approved Device.

To Whom It May Concern:

In October 2010 our company was contacted by the client regarding the design and construction of the Weir Wall Filtration Devices. The client provided the information on the originally designed screen systems and asked if we could provide a similar system.

Our design team with over 25 years experience reviewed the documents (originally drafted by Katchall Filtration Systems, LLC). The information and design concept provided was conceptual in nature and neglected to contain the appropriate amount of detail for effective design. Several details were left out of the concepts which are necessary for appropriate operation and installation.

Based upon the information provided and a site visit we designed a comparable system that exceeds all the specifications of the Katchall System. It was found the materials and construction method recommended by Katchall lacked the structural integrity to properly function inside a channel. The Bio Clean Weir Wall Filtration Device meets all the specifications of the approved device plus improves upon many factors that were not addressed in the original design.

The following pages show the original Katchall information and concept drawings. Following this information is the specification and drawings we are providing. The verbiage and illustration provided by us shall prove that the design we are recommending exceeds the original design approved. Overall, the design we are providing the customer will exceed in performance and functionality that which was originally proposed.

The Bio Clean Weir Wall Filtration Devices have been installed by the Chula Vista School District, the County of San Diego and the City of Los Angeles.

The system provided by Bio Clean Environmental overcomes the following issues with the original design:

- Standing water created by a 2" channel mounted to the based. The filter media on our system extends to the floor and therefore does not create ponding.
- Enhanced 45 degree support brackets to deal with loading during high flows.

If you have any questions regarding this information please feel free to contact us directly.

Thank you for taking the time to review this information.

Sincerely,

Zachariha J Kent, CISEC

Stormwater Engineer

ANTIMICROBIAL FILTRATION WEIRS

2-INCH U-CHANNEL ACROSS ENTIRE WIDTH OF DRAINAGE CULVERT (BOTTOM)
2-inch U-Channel (vertical supports) placed every 4' – 2" for additional support during heavy-flow events

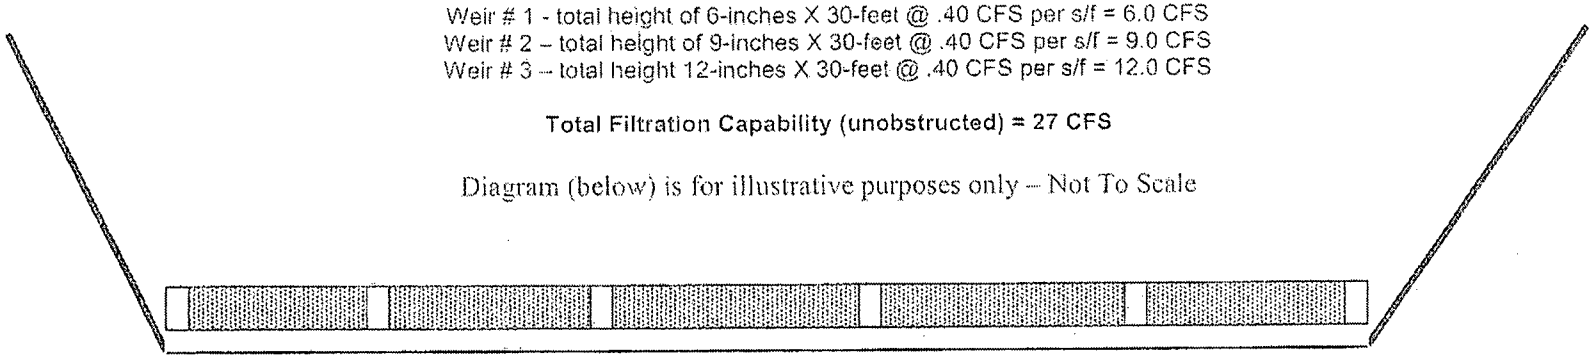
4-FOOT (REMOVABLE) SECTIONS OF ANTIMICROBIAL FILTRATION MEDIA
Media is "Pillow-Cased" around a supporting structure of 1 ½" reinforced open fiberglass grating and secured within U-Channels

SECTIONS – FLOW RATES

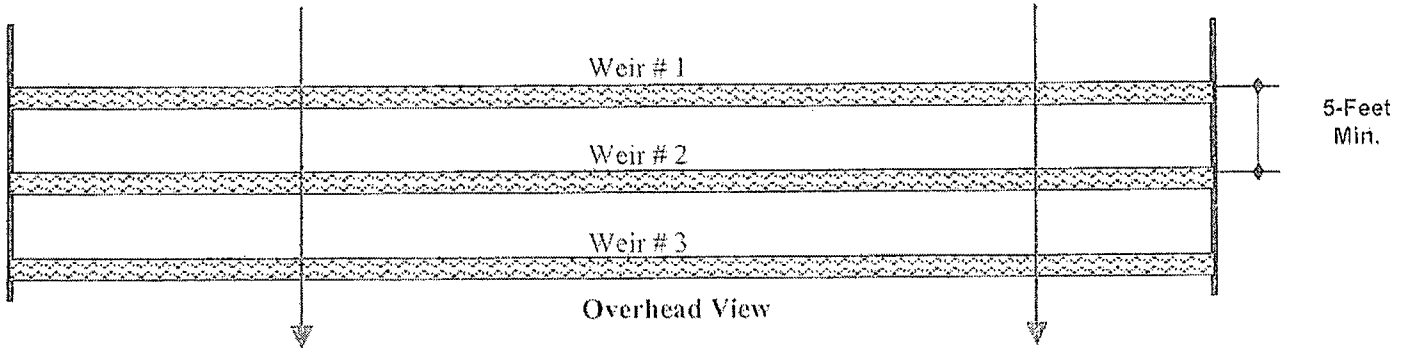
Weir # 1 - total height of 6-inches X 30-feet @ .40 CFS per s/f = 6.0 CFS
Weir # 2 – total height of 9-inches X 30-feet @ .40 CFS per s/f = 9.0 CFS
Weir # 3 – total height 12-inches X 30-feet @ .40 CFS per s/f = 12.0 CFS

Total Filtration Capability (unobstructed) = 27 CFS

Diagram (below) is for illustrative purposes only – Not To Scale



Cross Section



Overhead View

Approximation of Initial Cost

Factoring not less than three (3) filtration weir walls (see specifications previous page) we anticipate the initial costs (manufacturing, delivery and installation) not to exceed a total of:

Fourteen Thousand Five Hundred Dollars and 00 Cents ($14,500.00)

Unobstructed flow-rates will be in excess of 27.0 CFS and will have the following pollutant removal efficiencies

- 95% of all Fine Particulates larger than 50-microns
- 97% of all Oils and Greases
- 50% of all Nitrates, Phosphates and Phosphorus
- 55% of all Heavy Metals associated with particulate retentions
- 99.99% all Single-Cell Microorganisms with less than 1-second contact time required

MIXED MEDIA AVAILABILITY

1st Weir Wall to be replaced with a combination of media containing Perlite and Anthracite
2nd Weir Wall to be replaced with a combination of media containing Zeolite and Activated Carbons
3rd Weir Wall to remain media containing the proprietary antimicrobial agent

Difference in cost – Two Thousand Five Hundred Dollars and 00 Cents ($2,500.00)

Two sets of U-Channels were used – once as the "primary filters" and one as a "secondary filter"

The 2nd set of Channels and Filters were used to capture any materials that may become dislodged when removing and cleaning the primary filters

Once the primary filters were cleaned, repaired or replaced, the 2nd set was removed and stored for future use.

2nd set can also be used as "instant" replacements should the primary filters become fouled with excessive hydrocarbons.

ANTICIPATED MAINTENANCE PARAMETERS

(BREA CHANNEL - . WIER WALL FILTRATION DEVICES)

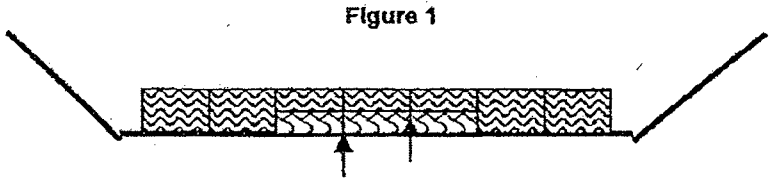
Whereas there is no specific data available, pertaining to the anticipated daily pollutant-loading factors, we have to take a "best-estimate" approach in regards to maintenance procedures and duration between cleaning / replacement of filtration medias.

As we understand it, the drainage channel will be subject to consistent flows (of approximately 1 CFS) with intermittent flows discharging as much as 20 CFS during peak hours (10 – 12 hours), during the larger 2/24 and 10/24 events.

The channel is currently proposed to be 30-foot in width; with three (3) rows of filtration media placed in graduated height weir wall sections. Each weir wall features removable filtration sections proposed to be appx 4-foot in width / each.

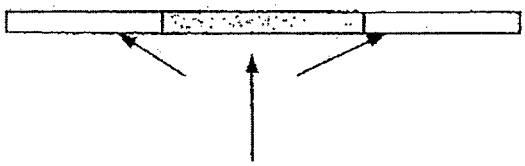
Daily discharges (1CFS) will tend to gravitate towards the middle of the channel, and flow through a limited number of the filtration sections, at a minimal depth of less than 1-inch - see **Figure 1**.

Figure 1



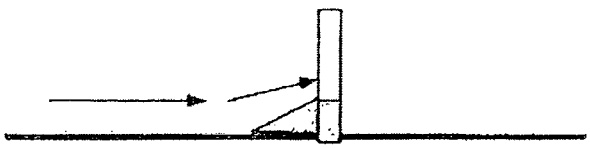
As each filter section removes displaced fine particulates and organic materials, additional discharges will seek the course of least resistance, gravitating to areas where obstructions have yet to occur. **See Figure 2.**

Figure 2



As deposits create obstructions along the entire (bottom) width of the filtration media, discharges will again seek the course of least resistance and flow over the previous obstructions, until new (unobstructed) filtration media is reached. **See Figure 3**

Figure 3



Placing the filtration devices in a vertical plane provide a much larger surface area for water penetration to occur, and thereby actually extend the usable service life of the media, prior to cleaning and or replacement. It has been our experience that filtration media (placed in a horizontal configuration, i.e. curb inlets, catch basins), tend to become obstructed much quicker as there is no additional "free" media surface area for the discharges to flow onto.

The design concept is radically simple in that as each section becomes partially obstructed it can be removed and cleaned, leaving the other (non-obstructed) sections in-place, providing pollutant removal during maintenance procedures.

Additionally, filtration media replacement cost is considerably less than may be originally anticipated as each obstructed section can be replaced by an un-obstructed section, cleaned and placed back into an exterior position. **See Figure 4**

Figure 4

Before Replacement

After Cleaning / Replacement

With three (3) rows of graduating height weir walls, (filtration medias) utilizing mixed medias, we anticipate that the following maintenance procedures would need to occur:

- **First Row – Sediment / Oils & Greases**
  - Dry Weather
    - Once every two (2) months
    - Visually inspect, clean and replace / rearrange filter sections
  - Wet Weather
    - Once every one (1) month
    - Visually inspect, clean and replace / rearrange filter sections
  - Annually
    - Replace Filtration Media
- **Second Row – Heavy Metals / Odors and some Bacteria**
  - Dry Weather
    - Once every two (2) months
    - Visually inspect, clean and replace / rearrange filter sections
  - Wet Weather
    - Once every one (1) month
    - Visually inspect, clean and replace / rearrange filter sections
  - Annually
    - Replace Filtration Media
- **Third Row – Pathogen**
  - Dry Weather
    - Once every two (2) months
    - Visually inspect, clean and replace / rearrange filter sections
  - Wet Weather
    - Once every one (1) month
    - Visually inspect, clean and replace / rearrange filter sections
  - Annually
    - Replace Filtration Media

Again, with no specific data available and whereas the filtration media will be subjected to 24/7 conditions, we suggest that the channel filters be visually observed for the first 30 – 60 days to determine the actual maintenance needs for this project.

We suggest that water quality testing needs to occur not less than once every three (3) months and used as an additional basis for determining the maintenance needs, based upon degradation of water quality via obstructions of the filtration medias.

Annual Cost Projections

Utilizing the anticipated maintenance procedures, as outlined previously, we anticipate the following:

- **Dry Season**
  - **Occurring twice (2X)**
  - Visually inspect all three (3) filtration weir walls
  - Remove, clean, rearrange as required
- **Wet Season**
  - **Occurring three (3X)**
  - Visually inspect all three (3) filtration weir walls
  - Remove clean, rearrange as required
- Annual Media Replacements
  - First Row
    - 60 square feet
    - Non-treated fabric
  - Second Row
    - 120 square feet
    - Zeolite – Perlite – Granulated Activated Carbon
  - Third Row
    - 150 square feet
    - Antimicrobial treated fabric / Granular activated carbon

It should be understood that these are *projections only* and that the actual field conditions will determine the true annual maintenance needs and their associated cost.

Bio Clean – Weir Wall Filtration Devices Specifications

Materials:

The Bio Clean Weir Wall Filtration Screens are made entirely of 316 Stainless Steel.

- The supporting frame is 1.25" x 1.25' x .1875" angle metal.
- All braces are 1.25" x .1875" flat bar.
- Screens are perforated 16 guage with .1875 diameter holes on .5" centers staggered.
- All hardware with stainless steel. Redheads will be used to mount the screens to the channels and are installed for easy removal.
- Each section of screen is 5' wide. Each weir incorporates two of the these screens mirroring each other and are spaced 3" apart to create void space for the media packs.

Filter Media:

The Bio Clean Weir Filtration Screens will incorporate a series of media booms housing various media for each of the three weirs.

- Weir # 1 – total height of 6" by 30' long incorporates perlite filtration media to remove TSS and other particulates. Specified flow rate as approved is .4 cfs per square foot media surface area which equals a total flow rate of 6 cfs (this information comes from original approval).
- Weir # 2 – total height of 9" by 30' long incorporates activated charcoal filtration media to remove particulate and dissolved pollutants including metals, organic compounds, hydrocarbons, metals and bacteria. Specified flow rate as approved is .4 cfs per square foot media surface area which equals a total flow rate of 9 cfs (this information comes from original approval).
- Weir # 3 – total height of 12" by 30' long incorporates a proprietary media containing a proprietary antimicrobial agent to remove bacteria. Specified flow rate as approved is .4 cfs per square foot media surface area which equals a total flow rate of 12 cfs (this information comes from original approval).

Reference: Pollutant Removal Testing

BioMediaGREEN Stormwater Filtration Media.

Waves Environmental is pleased to submit this report to Modular Wetland Systems, Inc. This report includes the laboratory analysis and photo documentation of testing procedures. The conclusions and recommendations are not part of this report since they are not part of the scope of work with Waves Environmental.

Scope of Work

Waves Environmental measured the percentage removal of various pollutants and TSS (Total Suspended Solids) retained/captured by BioMediaGREEN stormwater filtration media. The laboratory testing was accomplished by a specially designed flume to control flow and head through the filtration media. The dimensions of the media were 2.0 ft. wide by 0.5 ft. high and 0.25 ft. thick for a treatment surface area of approximately 1.00 sq. ft. The pollutants consisted of dissolved metals, dissolved nutrients, TSS, oil & grease, and TPH (Total Petroleum Hydrocarbons) and were provided by D-Tek Analytical Laboratories in a pre-mixed batch. This pre-mixed batch was mixed into a larger quantity of water to obtain a solution of contaminated water. A Sil-Co-Sil 106 Ground Silica was used to represent a fine TSS. Numerous grab samples were taken from the influent and effluent ends of the test unit. Grab samples were taken to the lab for analysis. A summary of the resulting data is presented in the report.

Description of Testing Apparatus

The flume was placed on an adjustable platform to allow for an appropriate amount of head, simulating conditions found in the field. A 2.0 ft. wide slab of BioMediaGREEN was placed inside the flume. A 500 gallon water truck was used to discharge the contaminated water through a 2" valve into the flume at a rate of 70 to 90 gpm. Flow through the media was anticipated to be between 2 and 5 gpm once a maximum head of 0.5 ft. was reached.

Test Set Up

The test was designed to simulate the pollution that occurs during a rainfall event to measure the effectiveness of BioMediaGREEN. Michael Alberson a CPESC, CPSWQ and REA from Waves Environmental performed the testing, measurements, and pollutant sampling. A specially designed flume was constructed and lined with rubber to provide a clean and uncontaminated surface to perform the testing.

The contaminated water was created by mixing a concentrated solution of the pre-mixed batch with 500 gallons of water. The pre-mix batch was put together by Mr. Alberson and D-Tek laboratories and contained the following pollutants, Nitrate or TKN, Oil & Grease, Ortho Phosphorus, Total Phosphorus, TSS, Cadmium, Copper, Lead, Nickel, Silver,

Zinc, and Mercury. This solution was added to the 500 gallon water tank and agitated with a mixer for a period of 15 minutes before and throughout the test period. Once mixed thoroughly a grab sample was taken form the tank influent (log -07-2698, 07-3828). These samples provided the influent levels of the polluted water to be compared with seven tests of effluent levels after treatment through the filtration media.

Testing Procedure

A flow meter and control valve regulated the flow between 2 to 5 gpm. Each test was conducted for approximately 1.25 minutes. Three grab samples of effluent water were used to get an average sample concentration. The sampling procedure of the effluent water is as follows: The contaminated water was allowed to flow through the filter for 30 seconds then one third of the effluent (treated) water was collected and poured into the sampling bottle. The second and third samples of treated water were taken after one minute and 1.5 minutes, respectively, and added to the sampling bottle.

It was observed that the visible hydrocarbons (a rainbow sheen floating on the surface) were present in the influent (before the BioMediaGREEN) and were not visible after leaving the backside (effluent), which indicated that the hydrocarbons were being absorbed by the media. The water collected in the downstream of the filter media was surprisingly clear and turbidity readings where very low.

As part of the initial sample of the influent readings where taken for pH, NTU and temperature. This initial information is as follows: time of testing started at 11:41 AM, wind was between 0.0-0.9 mph, temperature 79.4 degrees F, Barometric pressure 1011.0 hPa, starting pH = 8.73 and NTU= 39.1, altitude = 60 feet MSL.

Results

	Total Phosphorus	2.07	.63	**69.7%**
	TSS	84.63	12.4	**85.4%**
	Cadmium	0.39	0.19	**52.2%**
	Copper	0.57	0.12	**79.2%**
	Lead	0.38	0.01	**98.2%**
	Nickel	0.55	0.43	**22.5%**
	Zinc	0.75	0.16	**78.2%**
	TPH	1.4	0	**100.00%**

Summary

A total of eight runs where performed to provide verifiable removal efficiencies. After four 1.25 minute runs through the BioMediaGREEN stormwater filter media the effluent concentrations coming out of the system where analyzed and compared to influent concentrations. An influent concentration was sampled at the influent end of the system, prior to entering the systems filter processes. The BioMediaGREEN filter media demonstrated substantial reductions in the concentrations of various pollutants. Following is a summary of the effluent concentrations and resulting removal efficiencies.

There was an average effluent concentration of 6.5 mg/L for oil and grease, 0 mg/l for TPH (total petroleum hydrocarbons), resulting in an average removal efficiency of 90.7% and 100% respectively.

There was an average effluent concentration of 12.4 mg/L for TSS (mean particle size of 19 microns), .32 NTU for turbidity, resulting in an average removal efficiency of 85.4% and 99.1% respectively.

Removal of dissolved heavy metals varied. Copper, Lead, and Zinc are seen as big three in terms of adverse affects on water quality. There was an average effluent concentration of .12 mg/L for Copper, less than .01 mg/L for Lead, and .16 mg/L for Zinc resulting in an average removal efficiency of 79.2%, 98.2%, and 78.2% respectively.

Removal of nutrients varied among test runs. There was an average effluent concentration of .63 mg/L for Total Phosphorus and 9.07 mg/L for total kjeldahl nitrogen resulting in an average removal efficiency of 69.7% and 12.7% respectively.

QUALITY CONTROL DATA REPORT

Report Date: 06/26/07

Log Numbers: 07-3828 through 07-3833

* LCS - Laboratory Control Sample. The LCS is a blank spiked with a known amount of method analyte(s) obtained from independent standards and is carried through all sample preparation and analytical procedures. Recoveries are calculated in order to evaluate method accuracy.

* Spike - The spike is an actual sample spiked with a known amount of method analyte(s) and is carried through all sample preparation and analytical procedures. Recoveries are calculated in order to evaluate potential matrix interferences.

* RPD = Rel % Difference = ((Result 1 - Result 2) / Average Result) X 100% The RPD provides a measure of method precision by comparing analytical results of 2 duplicate samples.

* % Recovery = ((Spike Sample Result - Sample Result) / Spike Conc) X 100% The result of the unspiked sample is treated as zero if it is less than established reporting limits.

METHOD BLANK

No target analytes were detected in the method blank.

LABORATORY CONTROL SAMPLE

Compound	% Recovery	Dup % Recovery	%RPD
TPH-Motor oil	88		
TPH-Diesel	100	101	1
TPH-Gasoline	94		

QUALITY CONTROL TERMINOLOGY

- LCS - LABORATORY CONTROL SAMPLE. Reported as % recovery of an independent standard carried through all sample preparation procedures to verify method performance. Acceptable range is 80% - 120% . Any out-of-control QC data is clearly indicated.
- Spike- environmental sample is matrix spiked with method compounds and % recovery of concentration spiked into sample is calculated. Reported as % recovery. Acceptable range for "Normal Matrix Sample" is 75% 125% . Any out-of-control QC data is clearly indicated.

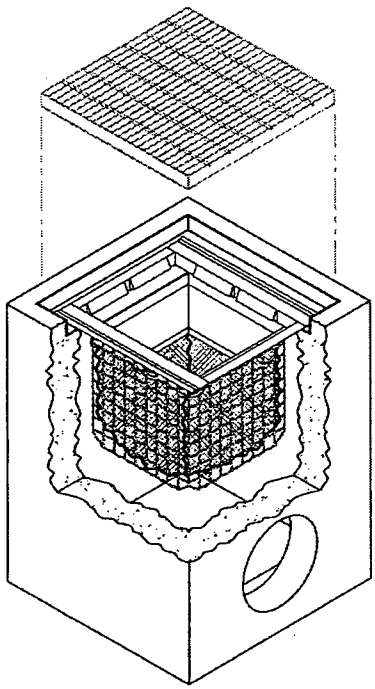
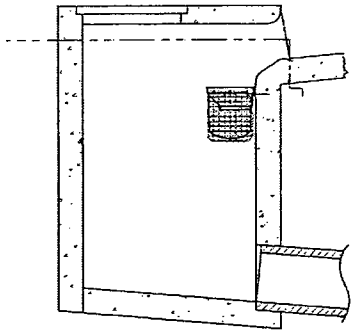
Flat grated inlet



Curb inlet



FloGard+PLUS® / Product Specifications

The FloGard+PLUS® is a multipurpose catch basin insert designed to capture sediment, debris, trash & oils/grease from low (first flush) flows.

A (dual) high-flow bypass allows flows to bypass the device while retaining sediment and larger floatables (debris & trash) AND allows sustained maximum design flows under extreme weather conditions.

FloGard+PLUS® inserts are available in sizes to fit most industry-standard drainage inlets (...flat grated, combination, curb and round inlets).

FloGard+PLUS® catch basin inserts are recommended for areas subject to silt and debris as well as low-to-moderate levels of petroleum hydrocarbon (oils and grease). Examples of such areas are vehicle parking lots, aircraft ramps, truck and bus storage yards, corporation yards, subdivision streets and public streets.

GENERAL SPECIFICATIONS FOR MAINTENANCE OF *FLO-GARD+PLUS*® CATCH BASIN INSERT FILTERS

SCOPE:

Federal, State and Local Clean Water Act regulations and those of insurance carriers require that stormwater filtration systems be maintained and serviced on a recurring basis. The intent of the regulations is to ensure that the systems, on a continuing basis, efficiently remove pollutants from stormwater runoff thereby preventing pollution of the nation's water resources. These specifications apply to the FloGard+Plus® Catch Basin Insert Filter.

RECOMMENDED FREQUENCY OF SERVICE:

Drainage Protection Systems (DPS) recommends that installed Flo-Gard+Plus® Catch Basin Insert Filters be serviced on a recurring basis. Ultimately, the frequency depends on the amount of runoff, pollutant loading and interference from debris (leaves, vegetation, cans, paper, etc.); however, it is recommended that each installation be serviced a minimum of three times per year, with a change of filter medium once per year. DPS technicians are available to do an on-site evaluation, upon request.

RECOMMENDED TIMING OF SERVICE:

DPS guidelines for the timing of service are as follows:

1. For areas with a definite rainy season: Prior to, during and following the rainy season.
2. For areas subject to year-round rainfall: On a recurring basis (at least three times per year).
3. For areas with winter snow and summer rain: Prior to and just after the snow season and during the summer rain season.
4. For installed devices not subject to the elements (washracks, parking garages, etc.): On a recurring basis (no less than three times per years).

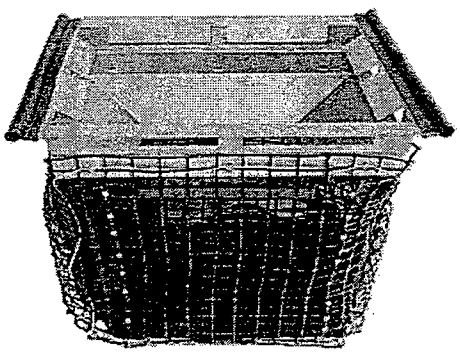
SERVICE PROCEDURES:

1. The catch basin grate shall be removed and set to one side. The catch basin shall be visually inspected for defects and possible illegal dumping. If illegal dumping has occurred, the proper authorities and property owner representative shall be notified as soon as practicable.
2. Using an industrial vacuum, the collected materials shall be removed from the liner. (Note: DPS uses a truck-mounted vacuum for servicing Flo-Gard+Plus® catch basin inserts.)
3. When all of the collected materials have been removed, the filter medium pouches shall be removed by unsnapping the tether from the D-ring and set to one side. The filter liner, gaskets, stainless steel frame and mounting brackets, etc. shall be inspected for continued serviceability. Minor damage or defects found shall be corrected on-the-spot and a notation made on the Maintenance Record. More extensive deficiencies that affect the efficiency of the filter (torn liner, etc.), if approved by the customer representative, will be corrected and an invoice submitted to the representative along with the Maintenance Record.
4. The filter medium pouches shall be inspected for defects and continued serviceability and replaced as necessary and the pouch tethers re-attached to the liner's D-ring. See below.
5. The grate shall be replaced.

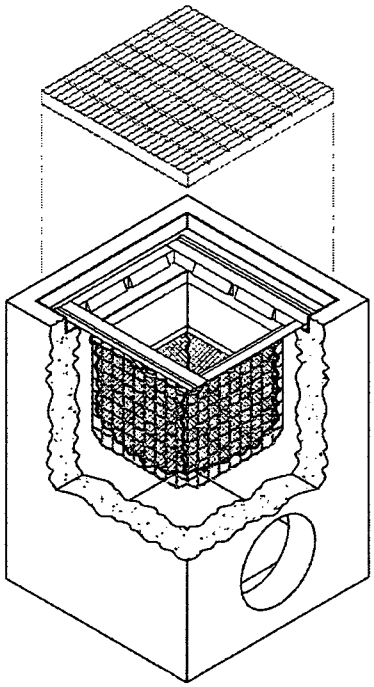
REPLACEMENT AND DISPOSAL OF EXPOSED FILTER MEDIUM AND COLLECTED DEBRIS

The frequency of filter medium pouch exchange will be in accordance with the existing DPS-Customer Maintenance Contract. DPS recommends that the medium be changed at least once per year. During the appropriate service, or if so determined by the service technician during a non-scheduled service, the filter medium pouches will be replaced with new pouches. Once the exposed pouches and debris have been removed, DPS has possession and must dispose of it in accordance with local, state and federal agency requirements.

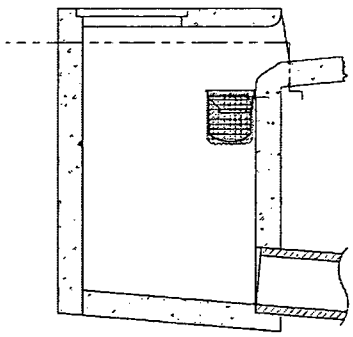
DPS also has the capability of servicing all manner of catch basin inserts and catch basins without inserts, underground oil/water separators, stormwater interceptors and other such devices. All DPS personnel are highly qualified technicians and are confined space trained and certified. Call us at (888) 950-8826 for further information and assistance.



Flat grated inlet



Curb inlet



FloGard+PLUS™ / Installation Guide

FloGard+PLUS™ Catch Basin Insert Filters are designed for installation in flat grated catch basins, combination (grated and curb opening) catch basins and curb opening catch basins.

They may be "Frame" mounted or "Wall" mounted depending on the type of catch basin.

Key elements of installation of the various devices and mounting methods are:

Frame Mount Insert Filter (for standard or irregular-dimensioned flat grated inlets):

- Remove the inlet grate and clean and remove any collected debris and trash from the catch basin.

- Clean off the grate bearing ledge and lower the filter assembly onto the ledge.

- Insure that the two floatable adsorbent pouches are tethered to the D-rings in the bottom corners of the assembly.

- Replace the inlet grate.

EFFECTIVE DATE: 01/01/08
EXPIRATION DATE: 01/01/09
Telephone: 800-899-8819

GENERAL APPROVAL - Renewal - "FloGard" Series Catch Basin Insert Filters manufactured by Kristar Enterprises, Inc. See attachment for list of approved model number.

DETAILS

Flo Gard Plus is a catch basin insert designed to treat rainwater runoff. These filters include a stainless steel frame, and geotextile fabric liner encapsulating an adsorbent which may be replaced. They are designed to collect particulate, debris, metals and petroleum hydrocarbons from stormwater runoff with a built-in flow bypass.

The approval is subject to the following conditions:

1. This product may be installed in a storm water treatment system outside of a building (commercial or a residential) structure.

2. The storm water treatment system shall be sized in accordance with the manufacturer's recommendations, Table -1 shown of Page 3, Table-2 of Page 4, and Chapter 11 and Appendix D, of Los Angeles Plumbing Code (LAPC), 2008 Edition.

3. Storm water drainage piping plans shall be submitted to Mechanical Plan Check and permit shall be obtained prior to installation of this product.

4. This product shall be maintained periodically per manufacturer's printed instructions.

5. The storm water systems shall be accessible for inspection and maintenance purposes.

6. A permit from Watershed Protection Division (Phone #: 213-482-7066), Department of Public Works, shall be required for each installation.

7. Each storm water quality device shall be permanently identified with the name "Kristar Enterprises," and appropriate model number.

DISCUSSION

LADBS G-5 (Rev. 7/06)

AN EQUAL EMPLOYMENT OPPORTUNITY - AFFIRMATIVE ACTION EMPLOYER

File and reports were examined by the Mechanical Testing Laboratory. The materials are equivalent to that prescribed by the Los Angeles Municipal Code (LAMC) in quality, strength, effectiveness, durability and safety.

For this General Approval to be valid on any individual construction project in the City of Los Angeles, an engineer or inspector of the Department of Building and Safety must make a determination that all conditions of the General Approval required to provide equivalency have been met in the case of each construction project under consideration.

This approval is granted under Sections 94.101.3, 94.301.1, 94.301.2, 94.307.0, 94.1101.1 and 94.1101.3 of LAPC, 2008 Edition.

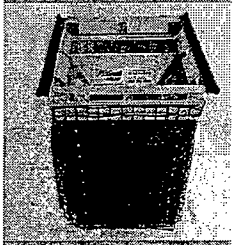
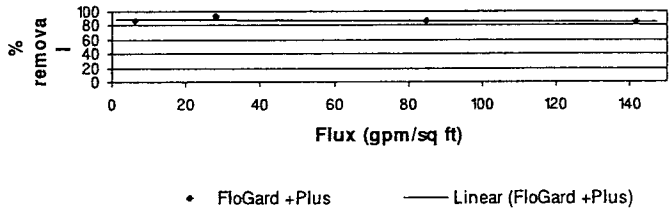
Kristar FloGard +PLUS® Catch Basin Insert Filter



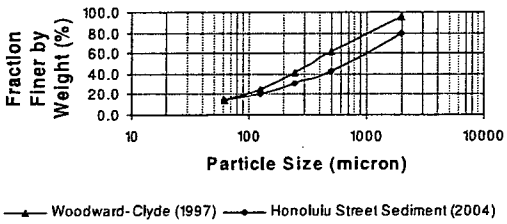
See product specifications for standard model details

Independent field tests conducted in Hawaii and New Zealand on FloGard +PLUS® Catch Basin Insert Filters to determine TSS removal efficiency. Results were extrapolated to a typical street deposited sediment particle size. Removal efficiencies were plotted and reflect effective TSS removal over the typical range of operating flow rates. Results are shown below as a function of unit internal surface area.

FloGard +Plus®
TSS Removal
Typical Urban Runoff Distribution*
***extrapolated from available field test data**



Street Deposited Sediment
Typical Particle Size Distribution
from urban runoff TSS survey data



Units are sized to fit most common styles of drainage inlet grate frames or inlet widths. Rated filtered flow capacities for each model typically exceed the required "first flush" treatment flow rate, and account for reduction in capacity as the unit accumulates suspended pollutants. Rated bypass capacity for each model also typically exceeds the inlet capacity of the catch basin.

Kristar's FloGard +PLUS® Catch Basin Insert Filter is an efficient inlet prefilter designed to remove suspended sediment and floatable trash and hydrocarbons from stormwater runoff in new or retrofit applications. It is ideally suited for removal of primary pollutants from paved surfaces in commercial and residential areas, or may form part of a treatment train. The device features a unique dual-bypass design, durable components, flexible installation options and easy maintenance access.

V. Implementation, Maintenance and Inspection Responsibility for BMPs (O&M Plan)

The property owner, California Brea Partners, L.P. will be responsible for common area maintenance. BOSC Equities is the general partner and manager responsible for day to day oversight on behalf of owner. The contact person for Bosc Equities is Mr. Marc Harris, 413 S. Associated Road, Brea, CA 92821; phone number (714) 990-5715. Mr. Harris shall be responsible for the management of the project site plus implementation and maintenance of the BMPs required by this WQMP.

Maintenance and inspection activities for the identified BMPs will be performed as indicated on the enclosed BMP Operation and Maintenance Plan (O&M). The Owner shall be responsible for all maintenance and inspection responsibilities for private common landscaped areas, private drives, parking areas, parking aisles, curbs and gutters, catch basins and storm drain system, and maintaining all applicable project related source control BMPs and treatment BMPs (vegetated swales).

Funding for long-term BMP Maintenance will be through fees collected in the form of lease and rental revenues; a portion of which shall be used to provide for long-term BMP maintenance of the site.

In addition, the **Owner shall retain all maintenance records for a period of five years after the recorded inspection date for the lifetime of the project. The records shall be made readily available for review by government agencies.**

The Owner shall also be required to submit an Annual Compliance Certification to the City of Brea based upon inspection and maintenance of all BMPs recommended and detailed in the Operation and Maintenance Plan contained within this WQMP. Annual self-compliance certification shall be based upon a review of the site inspection and maintenance reports conducted at the frequency recommended in the O&M Plan completed since the last annual self-compliance certification and a visual inspection of the entire site. The Certification submitted to the City will include copies of all inspection and maintenance records from the previous year. Annual compliance certification shall be completed and submitted to the City by July 1st of each year. The completed certificate should be sent to:

The City of Brea
Attention: NPDES Coordinator/City Engineer
1 Civic Center Circle
Brea, CA 92821

A copy of the Annual Certificate of Compliance is located at the end of this section.

The property owner, California Brea Partners, L.P. will be responsible for common area maintenance. BOSC Equities is the general partner and manager responsible for day to day oversight on behalf of owner.

Table 5, Operations and Maintenance Plan, Brea Plaza

BMP	Responsible Party	Maintenance Activity	Inspection/Maintenance Frequency*
Source Control BMPs (Structural and Non-Structural)			
N1. Education for Property Owners, Tenants and Occupants	The owner and owner's agent	The owner will insure that all tenants will be given a copy of the lease agreement, which will contain a section outlining the environmental awareness education materials. The owner shall establish requirements for the implementation of a community awareness program that informs tenants of the impacts of dumping oil, paints, solvents or other potentially harmful chemicals into the storm drain; the proper use and management of fertilizers, pesticides and herbicides in home landscaping and gardening practices; the impacts of littering and improper watering. Environmental awareness education materials, including, but not limited to those included in Section VII of this WQMP, shall be made readily available to all tenants at the signing of lease and periodically thereafter by management.	Educational information will be provided by the Owner to the Tenant at approval and signing of the lease; Annually thereafter. Other agencies providing services to businesses (The City of Brea, Metropolitan Water District, and the County of Orange) will continuously provide educational materials to residents as brochures and through the internet. See these websites for further information: http://www.ci.brea.ca.us/article.cfm?id=635 http://www.mwdoc.com/ http://www.ocwatersheds.com/PublicEducation/pe_introduction.asp
N2. Activity Restriction	The owner and owner's agent	Within the lease agreement to be prepared by the owner, language shall be included to identify surface water quality protection required by tenants. These may include restrictions on onsite vehicle maintenance, vehicle washings and stringent litter control. Surface water quality activities shall also be conducted in conformance with the Water Quality Management Plan and City of Brea Municipal Code, Ch. 13.32 Storm Water Drainage, as it relates to the handling and disposal of contaminants.	Daily.

Table 5, Operations and Maintenance Plan, "Brea Plaza"

BMP	Responsible Party	Maintenance Activity	Inspection/Maintenance Frequency*
N3. Common Area Landscape Management (IC-7)	The owner and owner's agent	Landscape management programs will be designed by the Owner, which will be responsible for maintaining all common areas within the site. These programs will include how to mitigate the potential dangers of fertilizer and pesticide usage. Ongoing maintenance will be consistent with the City of Brea's Water Conserving Landscape Ordinance, as referenced in the City's Municipal Code (Chapter 20.52), and the State of California Model Water-Efficient Landscape Ordinance. Native, drought tolerant plant material shall be employed wherever feasible.	Monthly during regular maintenance, manage landscaping in accordance with the Ongoing maintenance will be consistent with the City of Brea Water Conserving Landscape ordinance and the State of California Model Water-Efficient Landscape Ordinance.
N4. BMP Maintenance	The owner and owner's agent	Site management shall be responsible for implementation of each applicable non-structural, structural and treatment BMP as well as scheduling inspection and maintenance cleaning of all applicable structural BMP facilities. Site management shall be responsible for inspection and maintenance activities in landscape areas (see Section VI, Exhibit A). Debris and other water pollutants will be controlled, contained and disposed of in a proper manner by staff or the maintenance contractor. Section V refers.	Per these tables.

Table 5, Operations and Maintenance Plan, "Brea Plaza"

BMP	Responsible Party	Maintenance Activity	Inspection/Maintenance Frequency*
N11. Common Area Litter Control	The owner and owner's agent	The owner's assigned site maintenance staff shall be required to maintain weekly sweeping and trash pick-up within the project areas and landscape areas. This will be achieved through the use of a maintenance contractor or site staff. Trash areas and receptacles will be inspected daily to make sure lids are closed, that surrounding areas are trash-free and that full receptacles are regularly emptied. Pursuant to Section V, responsibility shall include the emptying of trash receptacles, noting of disposal violations by tenants, and reporting such violations to management for investigation.	Daily inspection and weekly grooming and clean-up.
N12. Employee Training	The owner and owner's agent	An employee training/education program will be established as it would apply to all employees and contractors of the site to inform and train employees engaged in maintenance activities regarding the impact of improper disposal of sediments, wastes, chemicals and other potential pollutants; the proper use of fertilizers and pesticides in landscaping maintenance practices; and the impacts of littering and improper water disposal.	Upon first hire and annually thereafter for employees and volunteers, to include the educational materials contained in the approved Water Quality Management Plan.
N14. Common Area Catch Basin Inspection	The owner and owner's agent	All private common area onsite catch basins and area drains, inlets and storm drain facilities will be inspected, cleaned and maintained on a monthly basis in conjunction with landscape maintenance, as necessary and at a minimum prior to the storm season, no later than October 1st of each year.	Once a month to clean debris, silt and trash accumulated at area drains and inlets. October 1ST of each year, prior to "first flush" storm.

Table 5, Operations and Maintenance Plan, "Brea Plaza"

BMP	Responsible Party	Maintenance Activity	Inspection/Maintenance Frequency*
N15. Street Sweeping Private Streets and Parking Lots (IC-15)	The owner and owner's agent	The owner's site maintenance staff shall be responsible for ensuring that all streets and any common parking areas vacuum swept on a weekly basis. This procedure may be intensified around October 1st of each year prior to the "first flush" storm if needed.	Sweep once per week and as needed.
Provide Storm Drain System Stenciling and Signage (SD-13)	The owner and owner's agent	Stencil "No Dumping – Drains to Ocean" on all catch basins in paved areas where visibility is high.	Re-stencil every six months or as needed
Design and Construct Trash and Waste Storage Areas to Reduce Pollutant Introduction (SD-32)	The owner and owner's agent	Trash area will be designed with enclosures to prevent storm water runoff from the storage area. Drainage from adjacent areas will be diverted around trash storage area to avoid run-on. Trash will be removed on a regular basis or as required. In addition, these areas will be checked on a daily basis for debris and overfill.	All trash and waste areas shall inspected daily and emptied weekly.
Use Efficient Irrigation Systems & Landscape Design (SD-10, SD-12)	The owner and owner's agent	As a part of the design of all landscape areas, similar planting material with similar water requirements will be used in order to reduce excess irrigation runoff and promote infiltration. Such landscaped areas will be maintained by the owner/operator. As a part of the design of all area landscape irrigation, implementation of the City of Brea Water Conserving Landscape ordinance and Water Management Program ordinance, including, but not limited to, such provisions as water sensors, programmable irrigation times (for short cycles), etc., will be used. Such common areas will be maintained by the owner/operator.	Inspected once a week, in conjunction with maintenance operations. Verify that runoff minimizing landscape design continues to function by checking that water sensors are functioning properly, that irrigation heads are adjusted properly to eliminate overspray to hardscape areas, and to verify that irrigation timing and cycle lengths are adjusted in accordance with water demands, given time of year, weather and day or night time temperatures.

Table 5, Operations and Maintenance Plan, "Brea Plaza"

BMP	Responsible Party	Maintenance Activity	Inspection/Maintenance Frequency*
Building Maintenance (IC-3)	The owner and owner's agent	Properly collect and dispose of wash water from building washings, sidewalk washings and other power-washing activities. Properly prepare work areas so as to prevent the discharge of wash water to storm drain system.	Continuous with cleaning activities. Any washing will be conducted on an as-needed basis with dry methods preferred.
Outdoor Loading and Unloading of Materials (IC-10)	The owner and owner's agent	Keep loading area clean at all times with good housekeeping practices, inspect for trash, litter, debris and spills. Remove and discard of properly as necessary. Sweeping of area preferred over washdown. If washdown is used, all water shall be contained and not discharged to the storm drain system.	Inspect area daily. Clean up spills immediately. Clean as needed and at minimum, once per week with routine parking lot sweeping.
Wash water control for food preparation areas (IC-22)	The owner and owner's agent	Restaurants and food-preparation areas will not employ garbage disposals and will discourage the disposal of food wastes to the sanitary sewer system. The onsite restaurant will have a grease interceptor to help minimize the effects of Food, Oils and Grease (FOG) on the sanitary sewer. Food Preparation areas will additionally follow BMP guidelines specified in IC-22 Eating and Drinking Establishments.	Food preparation areas will be maintained continuously with the operation of the restaurant. The grease interceptor will inspected daily for leaks and volume levels that would require maintenance or removal to an approved, offsite grease recycling facility)

Table 5, Operations and Maintenance Plan, "Brea Plaza"

BMP	Responsible Party	Maintenance Activity	Inspection/Maintenance Frequency*
Treatment Control BMPs			
Vegetated Swales (TC-30)	The owner and owner's agent	Periodic mowing to keep grass height at approximately 6", weed control, watering, reseeding bare areas, clearing of debris and blockages. Inspect at least twice per year for signs of erosion, damage, debris and sediment accumulation. Additional inspections after periods of heavy runoff recommended. Inspect periodically for pools of standing water.	Inspect swales at least twice annually for erosion, damage to vegetation, and sediment and debris accumulation preferably at the end of the wet season to schedule summer maintenance and before major fall runoff to be sure the swale is ready for winter. However, additional inspection after periods of heavy runoff is desirable. The swale should be checked for debris and litter, and areas of sediment accumulation on a monthly basis. Maintenance will be on an as-needed basis and in conjunction with weekly landscape maintenance. Sediment accumulating near culverts and in channel should be manually removed when it builds up to 75 mm (3 in.) at any spot, or covers vegetation.

Table 5, Operations and Maintenance Plan, "Brea Plaza"

BMP	Responsible Party	Maintenance Activity	Inspection/Maintenance Frequency*
Bio Clean Basin Weir System	The owner and owner's agent	Filters will be visually inspected for debris blockage and wear and replaced or rearranged as necessary.	First Row – Sediment/Oils & Greases Dry Weather: Once every 2 months Wet Weather: Once every month Annually: Replace filter media Second Row – Heavy Metals/ Odors & Some Bacteria Dry Weather: Once every 2 months Wet Weather: Once every month Annually: Replace filter media Third Row – Pathogen Dry Weather: Once every 2 months Wet Weather: Once every month Annually: Replace filter media Trash & debris found in the filter will be disposed of in the trash. Sediments must be collected by use of a vactor truck which vacuums the sediments out of the drop inlets and other drainage structures. The sediments are then transported daily to designated sites. Registered transporters are used to ship any hazardous sediments from the sites to authorized hazardous wasted disposal facilities under standard California Uniform Hazardous Waste Manifests. The filter replacements will be disposed of by the manufacturer, per their cost estimate for annual inspections.

Table 5, Operations and Maintenance Plan, "Brea Plaza"

BMP	Responsible Party	Maintenance Activity	Inspection/Maintenance Frequency*
Kristar FloGard+PLUS Insert Filters	The owner and owner's agent	1. The catch basin grate shall be removed and set to one side. The catch basin shall be visually inspected for defects and possible illegal dumping. If illegal dumping has occurred, the proper authorities and property owner representative shall be notified as soon as practicable. 2. Using an industrial vacuum, the collected materials shall be removed from the liner. (Note: DPS uses a truck-mounted vacuum for servicing Flo-Gard+Plus® catch basin inserts.) 3. When all of the collected materials have been removed, the filter medium pouches shall be removed by unsnapping the tether from the D-ring and set to one side. The filter liner, gaskets, stainless steel frame and mounting brackets, etc. shall be inspected for continued serviceability. Minor damage or defects found shall be corrected on-the-spot and a notation made on the Maintenance Record. More extensive deficiencies that affect the efficiency of the filter (torn liner, etc.), if approved by the customer representative, will be corrected and an invoice submitted to the representative along with the Maintenance Record. 4. The filter medium pouches shall be inspected for defects and continued serviceability and replaced as necessary and the pouch tethers re-attached to the liner's D-ring. 5. The grate shall be replaced.	Drainage Protection Systems (DPS) recommends that installed Flo-Gard+Plus® Catch Basin Insert Filters be serviced on a recurring basis. Ultimately, the frequency depends on the amount of runoff, pollutant loading and interference from debris (leaves, vegetation, cans, paper, etc.); however, it is recommended that each installation be serviced a minimum of three times per year, with a change of filter medium once per year. DPS technicians are available to do an on-site evaluation, upon request. DPS guidelines for the timing of service are as follows: 1. For areas with a definite rainy season: Prior to, during and following the rainy season. 2. For areas subject to year-round rainfall: On a recurring basis (at least three times per year). 3. For areas with winter snow and summer rain: Prior to and just after the snow season and during the summer rain season. 4. For installed devices not subject to the elements (washracks, parking garages, etc.): On a recurring basis (no less than three times per years). The frequency of filter medium pouch exchange will be in accordance with the existing DPS-Customer Maintenance Contract. DPS recommends that the medium be changed at least once per year. During the appropriate service, or if so determined by the service technician during a non-scheduled service, the filter medium pouches will be replaced with new pouches. Once the exposed pouches and debris have been removed, DPS has possession and must dispose of it in accordance with local, state and federal agency requirements. Sediments must be collected by use of a vactor truck which vacuums the sediments out of the drop inlets and other drainage structures. The sediments are then transported daily to designated sites. Registered transporters are used to ship any hazardous sediments from the sites to authorized hazardous wasted disposal facilities under standard California Uniform Hazardous Waste Manifests. Structural integrity of broken or otherwise damaged inserts shall be repaired/replaced by Drainage Protection Systems (DPS) at (800) 579-8819 for the life of the project

Forms to Record BMP Implementation, Maintenance, and Inspection

The form that will be used to record implementation, maintenance, and inspection of BMPs is attached. (Make copies of the following master form as necessary)

Recordkeeping

All records must be maintained for at least five (5) years and must be made available for review upon request.

Annual Compliance Certification

The form that will be used to certify implementation, maintenance, and inspection of BMPs is attached following the Record Form. (Make copies of the following master form as necessary). Annual self-compliance certification shall be completed and submitted to the City by July 1 of each year. The completed certificate should be sent to the City of Brea.

The City of Brea
Attention: NPDES Coordinator/City Engineer
1 Civic Center Circle
Brea, CA 92821

RECORD OF BMP IMPLEMENTATION, MAINTENANCE, AND INSPECTION

Today's Date: _____

Name of Person Performing Activity (Printed): _____

Signature: _____

BMP Name (As Shown in Table 5)	Brief Description of Implementation, Maintenance, and Inspection Activity Performed

ANNUAL CERTIFICATE OF COMPLIANCE

Project: Brea Plaza Year: _____

CERTIFICATION: I certify that the above named project has complied with the inspection and maintenance frequencies specified for the onsite Best Management Practices (BMPs) detailed in the Operation and Maintenance Plan and the Water Quality Management Plan for the project. The project includes these routine source control BMPs:

X	N1. Education for Property Owners	X	Provide Storm Drain System Stenciling and Signage
X	N2. Activity Restriction		Outdoor Material Storage Areas
X	N3. Common Area Landscape Management	X	Use Efficient Irrigation Systems & Landscape Design
X	N4. BMP Maintenance	X	Protect Slopes and Channels and Provide Energy Dissipation
	N5. Title 22 CCR Compliance		Loading Docks
X	N7. Spill Contingency Plan		Maintenance Bays
	N8. Underground Storage Tank Compliance		Vehicle Wash Areas
	N9. Hazardous Materials Disclosure Compliance		Outdoor Processing Areas
	N10. Uniform Fire Code Implementation		Equipment Wash Areas
X	N11. Common Area Litter Control		Fueling Areas
X	N12. Employee Training		Hillside Landscaping
	N13. Housekeeping of Loading Docks	X	Wash Water Controls for Food Preparation Areas
X	N14. Catch Basin (Area Drain, Inlet) Inspection		Community Car Wash Racks
X	N15. Street Sweeping Public Streets and Parking Lots		
	N17. Retail Gasoline Outlets		

The Owner has also upheld the recommended inspection and maintenance schedule for the project's treatment BMPs:

LIST BMPs Vegetated Swales, Katchall Drain Inserts

This facility is in compliance with the requirements of the City of Brea, the Regional Water Quality Control Board and the National Pollution Discharge Elimination System. Copies of site inspection and maintenance reports are on file at main Facility offices.

Facility Owner/Director: _____

PROJECT Pollution PREVENTION

Printed on Recycled Paper

Even if you live miles from the Pacific Ocean, you may be unknowingly polluting it.

Did You Know?

- Most people believe that the largest source of water pollution in urban areas comes from specific sources such as factories and sewage treatment plants. In fact the largest source of water pollution comes from city streets, neighborhoods, construction sites, and parking lots. This type of pollution is sometimes called "non-point source" pollution.
- There are two types of non-point source pollution: stormwater and urban runoff pollution.
- Stormwater runoff refers to runoff resulting from rainfall. It is very noticeable during heavy rainstorms when large volumes of water drain off the urban landscape picking up pollutants along the way.
- Urban runoff can happen anytime of the year when excessive water use from irrigation, vehicle washing and other sources carries trash, lawn clippings and other urban pollutants into storm drains.

Where Does It Go?

- Anything we use outside homes, vehicles and businesses – like motor oil, paint, pesticides, fertilizers, and cleaners – can be blown or washed into the storm drains.
- A little water from a garden hose or rain can also send materials into the storm drains.
- Storm drains are separate from our sanitary sewer systems; unlike water in sanitary sewers (from sinks or toilets) water in the storm drains is not treated before entering our waterways.

Sources of Non-Point Source Pollution

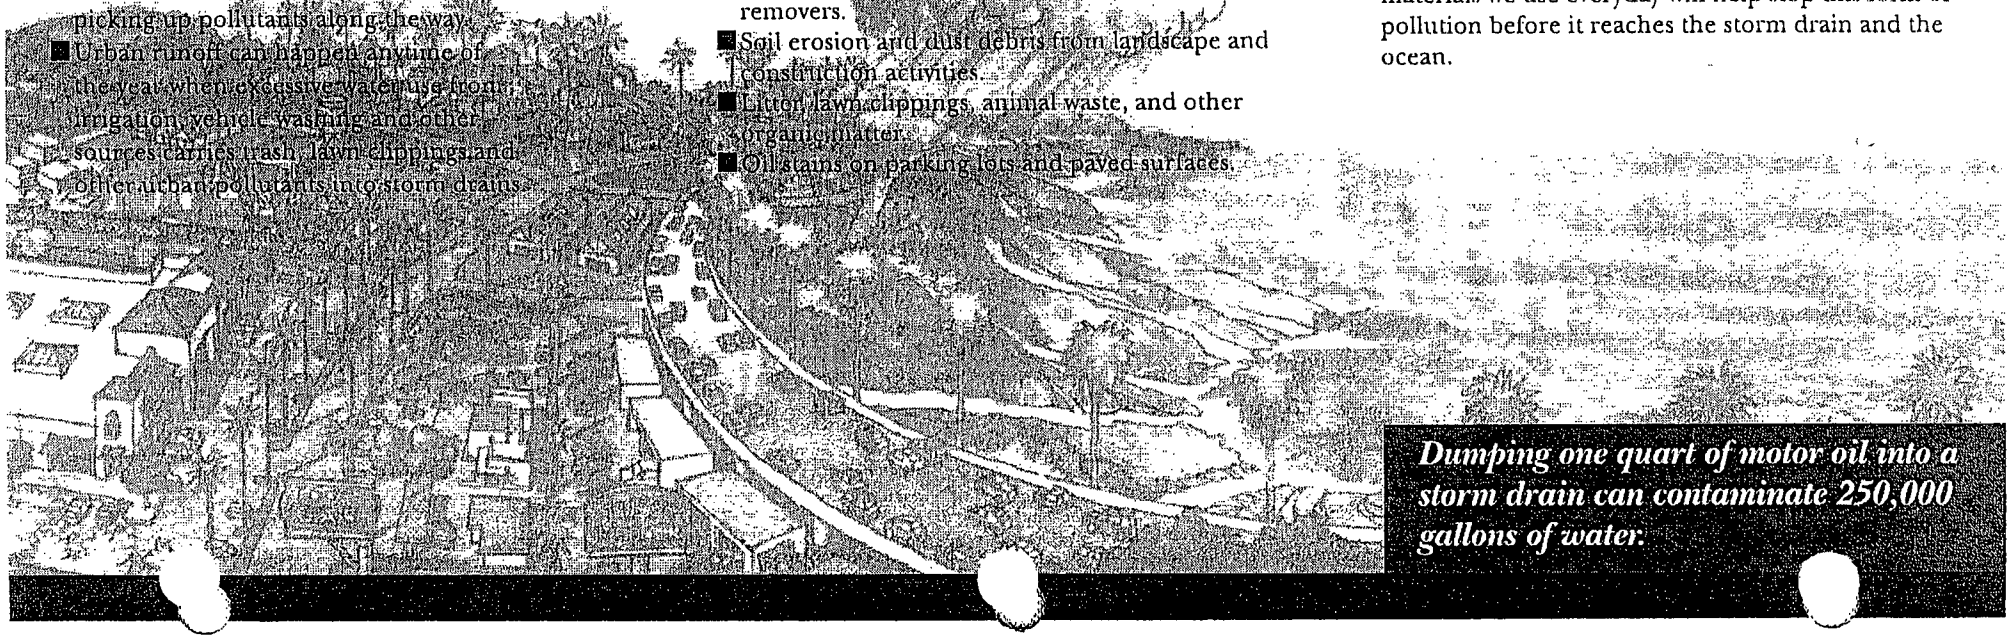
- Automotive leaks and spills.
- Improper disposal of used oil and other engine fluids.
- Metals found in vehicle exhaust, weathered paint, rust, metal plating, and tires.
- Pesticides and fertilizers from lawns, gardens and farms.
- Improper disposal of cleaners, paint and paint removers.
- Soil erosion and dust debris from landscape and construction activities.
- Litter, lawn clippings, animal waste, and other organic matter.
- Oil stains on parking lots and paved surfaces.

The Effect on the Ocean

Non-point source pollution can have a serious impact on water quality in Orange County. Pollutants from the storm drain system can harm marine life as well as coastal and wetland habitats. They can also degrade recreation areas such as beaches, harbors and bays.

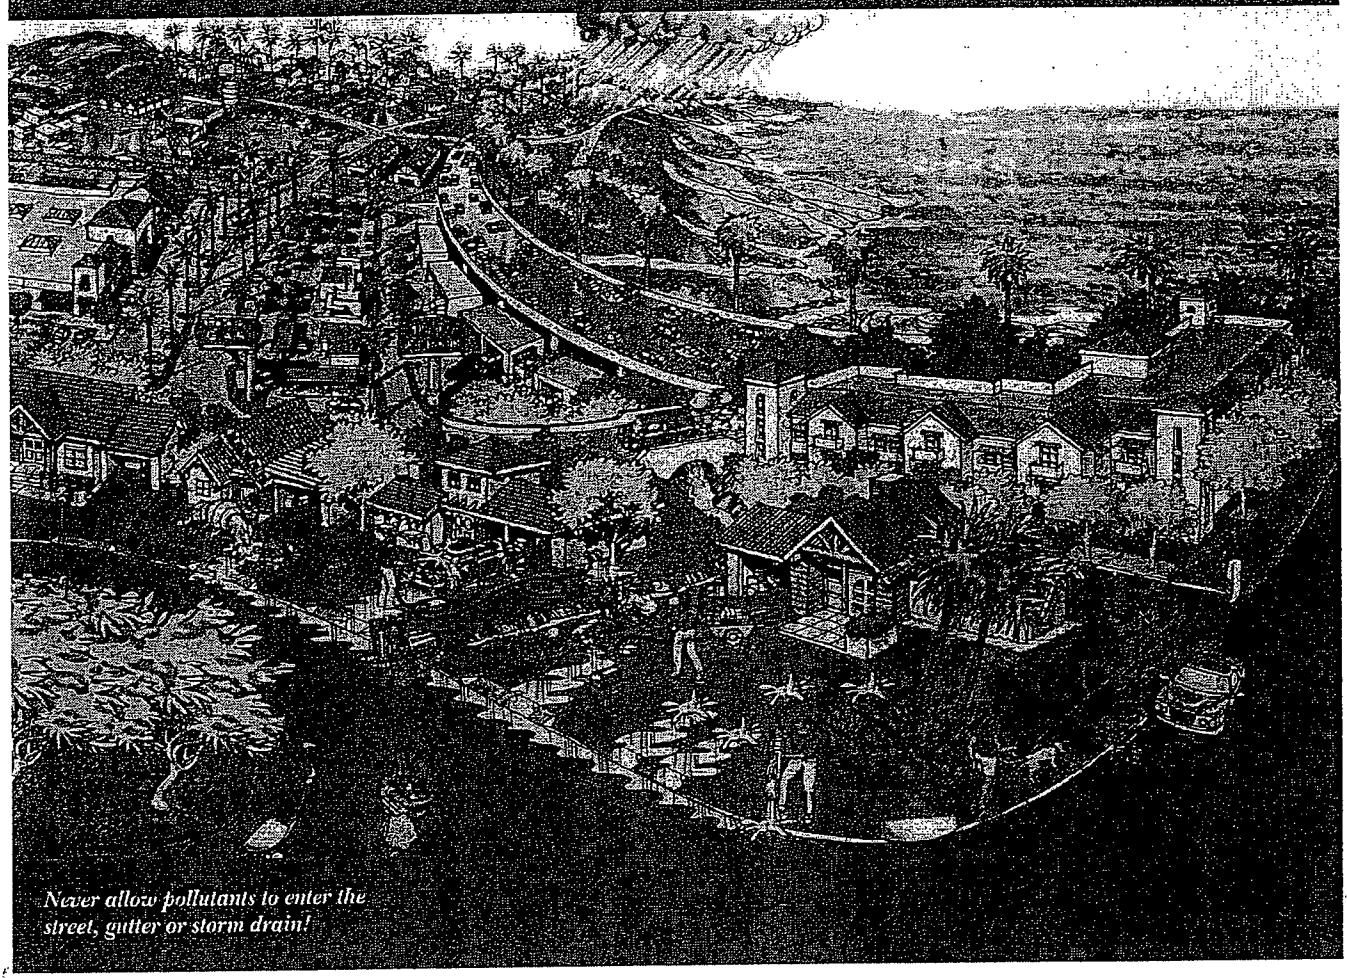
Stormwater quality management programs have been developed by the Orange County Stormwater Program under National Pollutant Discharge Elimination System (NPDES) permits. The program educates and encourages the public to protect water quality, monitor runoff in the storm drain system, manage NPDES permit process for municipalities, investigate illegal disposals, and maintain storm drains.

The support of Orange County residents, businesses and industries is needed to improve water quality and reduce the threat of stormwater and urban runoff pollution. Proper use and disposal of materials we use everyday will help stop this form of pollution before it reaches the storm drain and the ocean.



Dumping one quart of motor oil into a storm drain can contaminate 250,000 gallons of water.

The Ocean Begins at Your Front Door



Never allow pollutants to enter the street, gutter or storm drain!

Follow these simple steps to help reduce water pollution:

Household Activities

- Do not rinse spills with water. Use dry cleanup methods such as applying cat litter or another absorbent material, sweep and dispose of in trash. Take items such as used or excess batteries, oven cleaners, automotive fluids, painting products, and cathode ray tubes, like TVs and computer monitors, to a Household Hazardous Waste collection center.
- For a household hazardous waste collection center near you call (714) 834-6752 or visit www.oclandfills.com.
- Do not hose down your driveway, sidewalk or patio to the street, gutter or storm drain. Sweep up debris and dispose of in trash.

Automotive

- Take your vehicle to a commercial car wash whenever possible. If you wash your vehicle at home, choose soaps, cleaners, or detergents labeled non-toxic, phosphate free or biodegradable. Vegetable and citrus-based products are typically safest for the environment.
- Do not allow washwater from vehicle washing into the street, gutter or storm drain. Excess washwater should be disposed of in the sanitary sewer (through a sink or toilet) or onto an absorbent surface like your lawn.
- Monitor vehicle for leaks and place a pan under leaks. Keep your vehicles well maintained to stop and prevent leaks.
- Never pour oil or antifreeze in the street, gutter or storm drain. Recycle these substances at a service station, a waste oil collection center or used oil recycling center. For the nearest Used Oil Collection Center call 1-800-CLEANUP or visit www.1800cleanup.org.

Pool Maintenance

- Pool and spa water must be dechlorinated and be free of excess acid, alkali or color to be allowed in the street, gutter or storm drain.
- Whenever possible, drain dechlorinated pool and spa water directly into the sanitary sewer but only when it is not raining.
- Some cities may have ordinances that do not allow pool water to be disposed into the storm drain. Check with your city.

Landscape and Gardening

- Do not over-water. Water your lawn and garden by hand to control the amount of water you use or set irrigation systems to reflect seasonal water needs. If water flows off your yard onto your driveway or sidewalk, your system is over-watering. Periodically inspect and fix leaks and misdirected sprinklers.
- Do not rake or blow leaves, clippings or pruning waste into the street, gutter or storm drain. Instead dispose of waste by composting, hauling it to a permitted landfill, or as green waste through your city's recycling program.
- Follow directions on pesticides and fertilizer, (measure, do not estimate amounts) and do not use if rain is predicted with 48 hours.
- Take unwanted pesticides to a Household Hazardous Waste Collection Center to be recycled. For locations and hours of Household Hazardous Waste Collection Centers call 714-834-6752 or visit www.oclandfills.com.

Trash

- Place trash and litter that cannot be recycled in securely covered trash cans.
- Whenever possible, buy recycled products.
- Remember: Reduce, Reuse, Recycle

Pet Care

- Always pick up after your pet. Flush waste down the toilet or dispose in the trash. Pet waste, if left outdoors, can wash into the street, gutter or storm drain.
- If possible, bathe your pets indoors. If you must bathe your pet outside, wash it on your lawn or another absorbent/permeable surface to keep the washwater from entering the street, gutter or storm drain.
- Follow directions for use of pet care products and dispose of any unused products at a Household Hazardous Waste Collection Center.

Common Pollutants

Home Maintenance
- Detergents, cleaners and solvents
- Oil and latex paint
- Swimming pool chemicals
- Outdoor trash and litter

Lawn and Garden
- Pet and animal waste
- Pesticides
- Clippings, leaves and soil
- Fertilizer

Automobile
- Oil and grease
- Radiator fluids and antifreeze
- Cleaning chemicals
- Brake pad dust

2. KEEPING PEST CONTROL PRODUCTS OUT OF CREEKS, RIVERS AND THE OCEAN

HOMEOWNER TIPS
PROTECTING WATER

Before Buying Pest Control Products

- Identify the pest.
- Decide if pest control products are the best control measure or if there are alternatives available.
- Are integrated pest management guidelines available for this pest?
- Read the product label:
  - Is the pest listed on the label?
  - Is it the best product for the pest?

Before Mixing Your Sprayer

- Read the label carefully.
- Buy only enough pesticide to treat the area affected by the pest.
- Check the weather and don't apply if it's windy or about to rain.
- Measure the area you're treating.
- Calculate how much spray to mix.
- Wear long sleeve shirt, long pants, shoes and any other protective equipment listed on the label and follow all the label precautions.
- Be prepared for spills and know how to clean them up.

When You're Ready To Spray

- Mix and load spray in an area where any spilled pesticide will not be able to drain or be washed away into storm drains, ditches, streams, ponds or other bodies of water.
- Mix sprayer on grass, not the sidewalk or driveway.
- Mix only as much as needed.

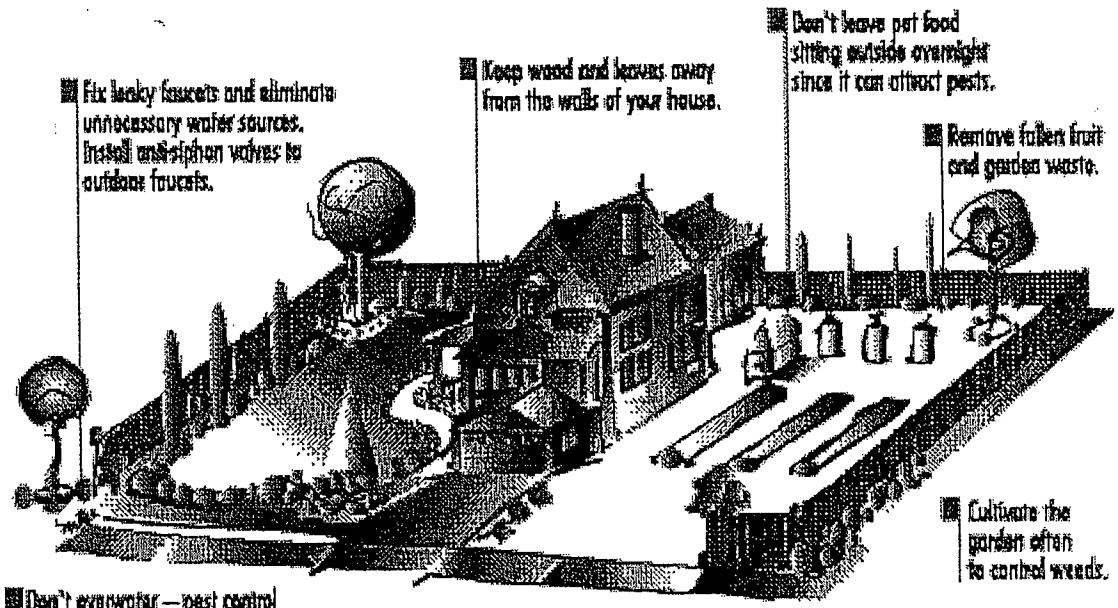
When You're Spraying

- AVOID spraying in or near storm drains, ditches, streams, and ponds!
- Leave an untreated strip around these areas to protect the water.

When You're done

- Never dump leftovers down any drain; Save for a future application.
- Triple-rinse sprayer and apply rinsewater to treated area.
- Take any old or unwanted pesticides to a Household Hazardous Waste Collection Center (714) 834-6752.

Using Pest Control Products. It's Your Responsibility To Do It Right!



IPM... Outsmarting Pests While Protecting Water

With Integrated Pest Management (IPM), homeowners use common sense and nature to make it difficult for pests to survive. IPM techniques include cultural practices (such as mulching to prevent weeds), encouraging natural enemies (good bugs), and judicious use of pest control products.

- First, identify your pest problem. To find the best solution, you need to pin down the problem. Consult gardening books, your county cooperative extension office or your local nursery.
- Decide how much pest control is necessary. If you can live with some pest damage, you can avoid intensive pest control product treatments.
- Choose an effective option. Try various types of controls first: washing bugs off plants, pruning diseased parts of plants. If you need to use pest control products, choose one that targets the problem and poses the least hazard.
- Finally, it's easier to prevent pests than to control them.

Think ahead.

This brochure is being distributed in order to reduce the impacts of pesticides on water quality. It was produced with support from the Orange County Storm Water Program, the Coalition for Urban/Rural Environmental Stewardship (CURES) and a 319(h) grant from the State Water Resources Control Board.

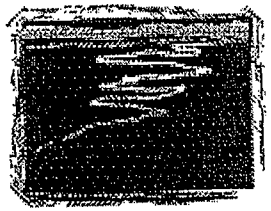
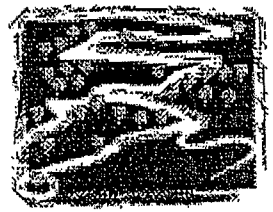
Keeping Pest Control Products Out of Creeks, Rivers and The Ocean





HOMEOWNER TIPS

PROTECTING WATER

3. TIPS FOR LANDSCAPE AND GARDENING

Clean beaches and healthy creeks, rivers, bays, and ocean are important to Orange County. However, many common activities can lead to water pollution if you're not careful. Fertilizers, pesticides and other chemicals that are left on yards or driveways can be blown or washed into the storm drains that flow to the ocean. Overwatering lawns can also send materials into the storm drains. Unlike water in sanitary sewers (from sinks and toilets), water in storm drains is not treated before entering our waterways.

You would never pour gardening products into the ocean, so don't let them enter the storm drains. Follow these easy tips to help prevent water pollution.

For more information, please call the Orange County Stormwater Program at (714) 567-6363 or visit www.ocwatersheds.com.

To report a spill, call the Orange County 24-Hour Water Pollution Reporting Hotline at (714) 567-6363.

For emergencies, dial 911.

The tips contained in this brochure provide useful information to help prevent water pollution while landscaping or gardening. If you have other suggestions, please contact your city's stormwater representatives or call the Orange County Stormwater Program.

Help Prevent Ocean Pollution:

Tips for Landscape & Gardening

The Ocean Begins at Your Front Door

PROJECT Pollution PREVENTION

Tips for Landscape and Gardening

Never allow gardening products or polluted water to enter the street or storm drain.

General Landscaping Tips

- Protect stockpiles and materials from wind and rain by storing them under tarps or secured plastic sheeting.
- Prevent erosion of slopes by planting fast-growing, dense ground covering plants. These will shield and bind the soil.
- Plant native vegetation to reduce the amount of water, fertilizer, herbicides, and pesticides needed.

- Never apply pesticides or fertilizers when rain is predicted within the next 48 hours.

Garden & Lawn Maintenance

- Do not over-water. Use irrigation practices such as drip irrigation, soaker hoses or micro spray systems. Periodically inspect and fix leaks and misdirected sprinklers.
- Do not rake or blow leaves, clippings or pruning waste into the street, gutter or storm drains. Instead dispose of waste by composting, hauling it to a permitted landfill, or as green waste through your city's recycling program.

- Use slow-release fertilizers to minimize leaching and use organic fertilizers.
- Read labels and use only as directed. Do not over-apply pesticides or fertilizers. Apply to spots as needed, rather than blanketing an entire area.
- Store pesticides, fertilizers and other chemicals in a dry covered area to prevent exposure that may result in the deterioration of containers and packaging.

- Rinse empty pesticide containers and re-use rinse water as you would use the product. Do not dump rinse water down storm drains. Dispose of empty containers in the trash.
- When available, use non-toxic alternatives to traditional pesticides and use pesticides specifically designed to control the pest you are targeting. For more information, check www.ipm.ucdavis.edu.
- If fertilizer is spilled, sweep up the spill before applying irrigation water. If the spill is liquid, apply an absorbent material like cat litter and then sweep and dispose in the trash.
- Take unwanted pesticides to a Household Hazardous Waste Collection Center to be recycled. Locations are provided below.

Household Hazardous Waste Collection Centers

Anaheim: 1071 N. Blue Gum St.
Huntington Beach: 17121 Nichols St.
Irvine: 6411 Oak Canyon
San Juan Capistrano: 32250 La Pata Ave.

For more information, call (714) 834-6752 or visit www.ocwatersheds.com

4. HELP PREVENT OCEAN POLLUTION: A GUIDE FOR FOOD SERVICE FACILITES

Grease blockage in sewer pipe

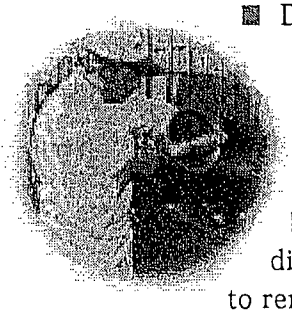
Photo Courtesy of the Monterey Regional Water Pollution Control Agency.

Prevent Fats, Oils, and Grease from Blocking the Sewers

Fats, oils, and grease (FOG) can cause sewer line blockages which can make sewage overflow into your facility and into storm drains that lead to the ocean. To stop the substances from building up in sewer lines, prevent them from entering your drains.

Practices in the Kitchen

- Collect waste cooking oil and grease in portable containers with lids. Transfer into drums or barrels for recycling.



- Do not pour oil or grease down any drain. Recycle or use absorbent materials and dispose of waste in the trash.
- Dry-wipe pots, pans, dishware, and work areas to remove all visible grease before washing. Dispose of waste in the trash.
- Use drain screens to capture food waste and dispose of properly into the trash.
- Train employees about proper grease disposal and post "NO GREASE" signs near all sinks or drains.

Illustrations courtesy of the City of Los Angeles

Maintenance of Grease Traps and Interceptors

- Reduce solids going to the grease trap or interceptor.
- Inspect and clean grease traps frequently to ensure proper operation.
- Have a licensed company inspect and pump out grease interceptors regularly to ensure proper operation.
- Keep maintenance records on-site for reference and regulatory review.

For more information, call the Orange County Stormwater Program at (714) 567-6363 or visit www.ocwatersheds.com.

Report sewage spills and discharges that are not contained to your site to the Orange County 24-Hour Water Pollution Reporting Hotline at (714) 567-6363.

For emergencies call 911.

CALIFORNIA Restaurant ASSOCIATION

Help Prevent Ocean Pollution:

A Guide for Food Service Facilities

The Ocean Begins at Your Front Door

PROJECT Pollution PREVENTION

Pollution Prevention

A clean ocean and healthy creeks, rivers, bays and beaches are important to Orange County. However, allowing debris from your business to enter the gutter and storm drains can lead to water pollution. Storm drains carry rainwater from our streets, and should never contain wash water, trash, grease or other materials. Unlike substances that enter the sanitary sewers (from sinks and toilets), substances that enter the storm drains do not receive treatment before entering our waterways. In addition, blocked sewer lines can cause raw sewage to back up into kitchens, bathrooms, city streets, storm drains, and our waterways.

USE GREASE INTERCEPTORS TO CAPTURE FATS, OILS AND GREASE (FOG).

This brochure will explain steps your food establishment can take to help preserve water quality by keeping debris out of storm drains and by preventing fats, oils, and grease from blocking sewer lines.

Cleaning Spills and Equipment

- **Never hose a spill into a gutter, street or storm drain!**
- Before mopping a wet kitchen spill, absorb it with towels, cat litter or other absorbent materials.
- Sweep up dry spills immediately and dispose of the material in the trash.

ABSORB WET SPILLS WITH CAT LITTER OR TOWELS; DISCARD IN THE TRASH.

- Scrape grease and food waste from floor mats and filters before cleaning. Dispose of scrapings in trash.
- After scraping, clean floor mats, filters, and garbage cans in a mop sink or a designated, curbed area connected to the sanitary sewer. Consider using a cleaning service for these activities.

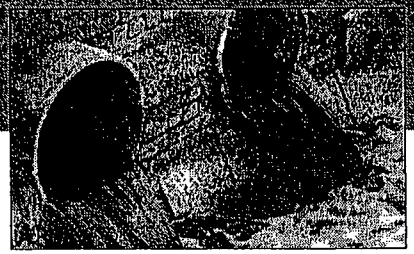
Dumpster/Grease Bin Area Cleaning

- Keep the area around the dumpster clear of trash and other debris. Do not overfill the dumpster.
- Cover dumpsters to block insects, animals, rainwater and wind.

- Sweep or vacuum up trash and throw it away.
- Absorb wet spills with cat litter, towels or similar materials. Discard in the trash.
- **Do not rinse your dumpster area!** Doing so can cause grease and trash to enter the storm drains.
- Have leaky dumpsters replaced.

USE JANITORIAL MOP SINKS FOR CLEANING MOPS, TOWELS AND FLOOR MATS.

5. HELP PREVENT OCEAN POLLUTION: PROPER MANAGEMENT GUIDELINES FOR YOUR BUSINESS



Preventing water pollution at your commercial/industrial site

A clean ocean and healthy creeks, rivers, bays and beaches are important to Orange County. However, many landscape and building maintenance activities can lead to water pollution if you're not careful. Paint, chemicals, plant clippings and other materials can be blown or washed into storm drains that flow to the ocean. Unlike water in sanitary sewers (from sinks and toilets), water in storm drains and streets is not treated before entering our waterways.

You would never pour soap or fertilizers into the ocean, so why would you let them enter the storm drains? Follow the easy tips in this brochure to help prevent water pollution.

Some types of industrial facilities are required to obtain coverage under the State General Industrial Permit. For more information visit www.swrcb.ca.gov/stormwater/industrial.html.

For more information, please call the Orange County Stormwater Program at (714) 567-6363 or visit www.ocwatersheds.com.

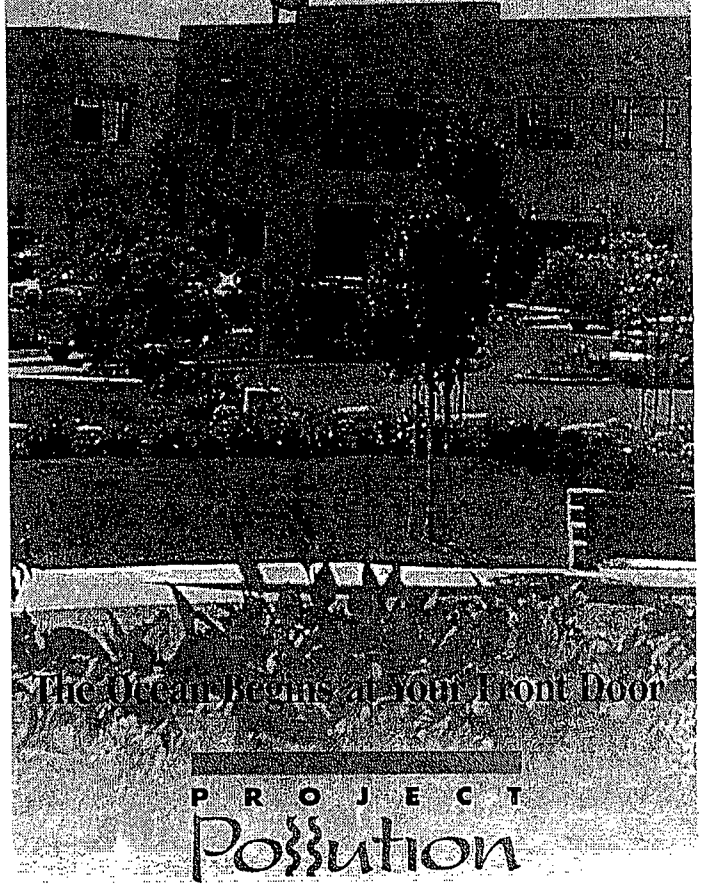
To report a spill, call the Orange County 24-Hour Water Pollution Reporting Hotline (714) 567-6363.

For emergencies dial 911.

RECYCLE USED OIL

Help Prevent Ocean Pollution

Proper Maintenance Practices for Your Business



The Ocean Begins at Your Front Door

PROJECT Pollution PREVENTION

Storm Drain Awareness and Maintenance Practices

Landscape Maintenance

- Compost grass clippings, leaves, sticks and other vegetation, or dispose at a permitted landfill or in green waste containers. Do not dispose of these materials in streets, waterways or storm drains.
- Irrigate slowly and inspect the system for leaks, overspraying and runoff. Adjust automatic timers to avoid over-watering.
- Follow label directions for the use and disposal of fertilizers, herbicides and pesticides.
- Do not apply pesticides, herbicides or fertilizers if rain is expected within 48 hours or if wind speeds are above 5 mph.
- Do not spray pesticides within 100 feet of waterways.
- Fertilizers should be worked into the soil rather than dumped onto the surface.
- If fertilizer is spilled on the pavement or sidewalk, sweep it up immediately and place it back in the container.

Building Maintenance

- Never allow wash water, sweepings or sediment to enter the storm drain.
- Sweep up dry spills and use cat litter, towels or similar materials to absorb wet spills. Dispose in the trash.
- If you must wash your building, sidewalk or parking lot, you **must** contain the water. Collect the water with a shop vac, and contact your city or sanitation agency for proper disposal information. Do not let water enter the street or storm drains.
- Use drop cloths underneath outdoor painting, scraping, and sandblasting work, and properly dispose of materials in the trash.
- Use a ground cloth or oversized tub for mixing paint and cleaning tools.
- Use a damp mop or broom to clean floors.
- Cover dumpsters to block insects, animals, rainwater and sand. Keep the area around the dumpster clear of trash and debris. Do not overfill the dumpster.
- Call your trash hauler to replace leaking dumpsters.
- Do not dump any toxic substance or liquid waste on the pavement, the ground, or toward a storm drain. Even materials that seem harmless — like latex paint or biodegradable cleaners — can damage the environment.

NEVER DISPOSE OF ANYTHING IN THE STORM DRAIN.

- Recycle paints, solvents, lumber and other materials.
- Store materials indoors or under cover and away from storm drains.
- Use chemicals that can be recycled. For more information about recycling and collection centers, visit www.oclandfills.com.
- Properly label materials. Familiarize employees with Material Safety Data Sheets.

6. TIPS FOR USING PAINT

Clean beaches and healthy creeks, rivers, bays and ocean are important to Orange County. However, many common activities such as painting can lead to water pollution if you're not careful. Paint must be used, stored and disposed of properly to ensure that it does not enter the street, gutter or storm drain. Unlike water in sanitary sewers (from sinks and toilets), water in storm drains is not treated before entering our waterways.

You would never dump paint into the ocean, so don't let it enter the storm drains. Follow these easy tips to help prevent water pollution.

For more information,
please call the
Orange County Stormwater Program
at (714) 567-6363
or visit
www.ocwatersheds.com

To report a spill,
call the
Orange County 24-Hour
Water Pollution Problem
Reporting Hotline
at (714) 567-6363.

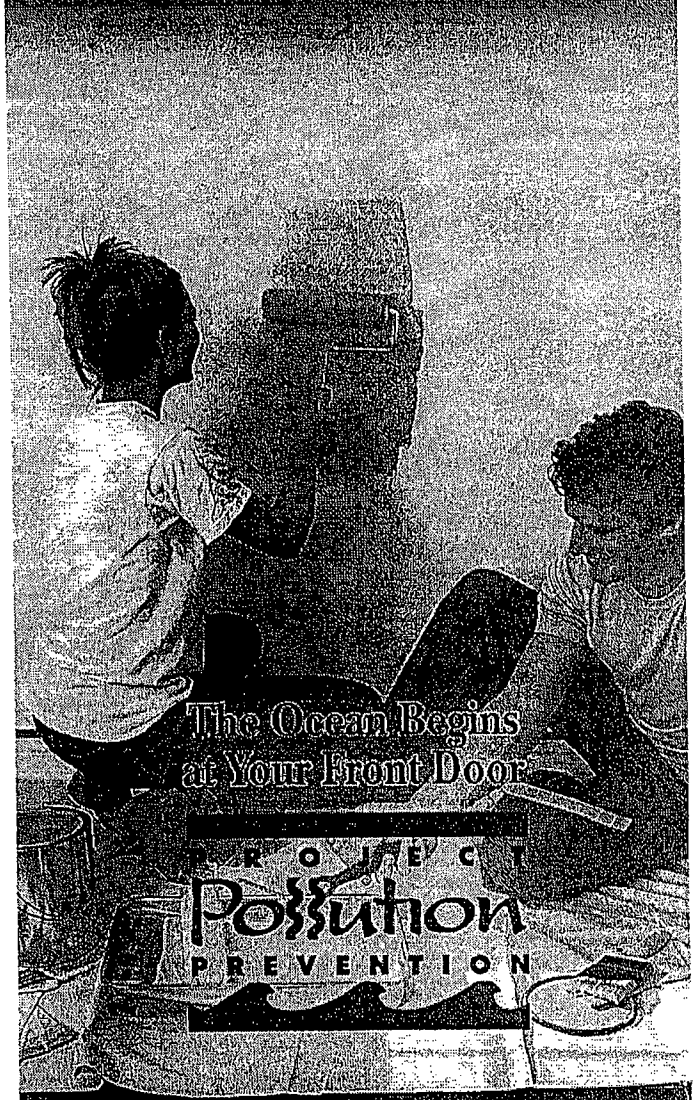
For emergencies, dial 911.

The tips contained in this brochure provide useful information to help prevent water pollution while using, storing and disposing of paint. If you have other suggestions, please contact your city's stormwater representatives or call the Orange County Stormwater Program.

Printed on Recycled Paper

Help Prevent Ocean Pollution:

Tips for Projects Using Paint



Tips for Projects Using Paint

Paint can cause significant damage to our environment. Whether you hire a contractor or do it yourself, it is important to follow these simple tips when purchasing, using, cleaning, storing and disposing of paint.

Purchasing Paint

- Measure the room or object to be painted, then buy only the amount needed.
- Whenever possible, use water-based paint since it usually does not require hazardous solvents such as paint thinner for cleanup.

Painting

- Use only one brush or roller per color of paint to reduce the amount of water needed for cleaning.
- Place open paint containers or trays on a stable surface and in a position that is unlikely to spill.
- Always use a tarp under the area or object being painted to collect paint drips and contain spills.

Cleaning

- Never clean brushes or rinse paint containers in the street, gutter or storm drain.
- For oil-based products, use as much of the paint on the brushes as possible. Clean brushes with thinner. To reuse thinner, pour it through a fine filter (e.g. nylon, metal gauze or filter paper) to remove solids such as leftover traces of paint.
- For water-based products, use as much of the paint on the brushes as possible, then rinse in the sink.
- Collect all paint chips and dust. Chips and dust from marine paints or paints containing lead, mercury or tributyl tin are hazardous waste. Sweep up and dispose of at a Household Hazardous Waste Collection Center (HHWCC).

Storing Paint

- Store paint in a dry location away from the elements.
- Store leftover water-based paint, oil-based paint and solvents separately in original or clearly marked containers.
- Avoid storing paint cans directly on cement floors. The bottom of the can will rust much faster on cement.
- Place the lid on firmly and store the paint can upside-down to prevent air from entering. This will keep the paint usable longer. Oil-based paint is usable for up to 15 years. Water-based paint remains usable for up to 10 years.

Alternatives to Disposal

- Use excess paint to apply another coat, for touch-ups, or to paint a closet, garage, basement or attic.
- Give extra paint to friends or family. Extra paint can also be donated to a local theatre group, low-income housing program or school.
- Take extra paint to an exchange program such as the **"Stop & Swap"** that allows you to drop off or pick up partially used home care products free of charge. **"Stop & Swap"** programs are available at most HHWCCs.
- For HHWCC locations and hours, call **(714) 834-6752** or visit **www.oclandfills.com**.

Disposing of Paint

- Never put wet paint in the trash.

For water-based paint:

- If possible, brush the leftover paint on cardboard or newspaper. Otherwise, allow the paint to dry in the can with the lid off in a well-ventilated area protected from the elements, children and pets. Stirring the paint every few days will speed up the drying.
- Large quantities of extra paint should be taken to a HHWCC.
- Once dried, paint and painted surfaces may be disposed of in the trash. When setting a dried paint can out for trash collection, leave the lid off so the collector will see that the paint has dried.

For oil-based paint:

- Oil-based paint is a household hazardous waste. All leftover paint should be taken to a HHWCC.

Aerosol paint:

- Dispose of aerosol paint cans at a HHWCC.

Spills

- Never hose down pavement or other impermeable surfaces where paint has spilled.
- Clean up spills immediately by using an absorbent material such as cat litter. Cat litter used to clean water-based paint spills can be disposed of in the trash. When cleaning oil-based paint spills with cat litter, it must be taken to a HHWCC.
- Immediately report spills that have entered the street, gutter or storm drain to the County's 24-Hour Water Pollution Problem Reporting Hotline at (714) 567-6363 or visit **www.ocwatersheds.com** to fill out an incident reporting form.

PROJECT Pollution PREVENTION

7. APPLICABLE FACT SHEETS

- IC3 BUILDING MAINTENANCE
- IC10 OUTDOOR LOADING/UNLOADING OF MATERIAL
- IC15 PARKING AND STORAGE AREA MAINTENANCE
- IC21 WASTE HANDLING AND DISPOSAL
- IC22 EATING AND DRINKING ESTABLISHMENTS

IC3. BUILDING MAINTENANCE

Best Management Practices (BMPs)

A BMP is a technique, measure or structural control that is used for a given set of conditions to improve the quality of the stormwater runoff in a cost effective manner[1]. The minimum required BMPs for this activity are outlined in the box to the right. Implementation of pollution prevention/good housekeeping measures may reduce or eliminate the need to implement other more costly or complicated procedures. Proper employee training is key to the success of BMP implementation.

MINIMUM BEST MANAGEMENT PRACTICES

Pollution Prevention/Good Housekeeping

- Properly collect and dispose of water when pressure washing buildings, rooftops, and other large objects.
- Properly prepare work area before conducting building maintenance.
- Properly clean and dispose of equipment and wastes used and generated during building maintenance.
- Store toxic material under cover when not in use and during precipitation events.

Stencil storm drains

Training

- Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.
- Provide on-going employee training in pollution prevention.

The BMPs outlined in this fact sheet target the following pollutants:

Targeted Constituents	
Sediment	x
Nutrients	x
Floatable Materials	
Metals	x
Bacteria	x
Oil & Grease	
Organics & Toxicants	
Pesticides	
Oxygen Demanding	

Provided below are specific procedures associated with each of the minimum BMPs along with procedures for additional BMPs that should be considered if this activity takes place at a facility located near a sensitive waterbody. In order to meet the requirements for medium and high priority facilities, the owners/operators must select, install and maintain appropriate BMPs on site. Since the selection of the appropriate BMPs is a site-specific process, the types and numbers of additional BMPs will vary for each facility.

1. **Properly collect and dispose of water when pressure washing buildings, rooftops, and other large objects.**
    - If pressure washing where the surrounding area is paved, use a water collection device that enables collection of wash water and associated solids. Use a sump pump, wet vacuum or similarly effective device to collect the runoff and loose materials. Dispose of the collected runoff and solids properly.
    - If pressure washing on a landscaped area (with or without soap), runoff must be dispersed as sheet flow as much as possible, rather than as a concentrated stream. The wash runoff must remain on the landscaping and not drain to pavement.
2. **Properly prepare work area before conducting building maintenance.**
    - Use ground or drop cloths underneath outdoor painting, scraping, and sandblasting work, and properly dispose of collected material daily.
    - Use a ground cloth or oversized tub for activities such as paint mixing and tool cleaning.
3. **Properly clean and dispose of equipment and wastes used and generated during building maintenance.**

[1] EPA " *Preliminary Data Summary of Urban Stormwater Best Management Practices*"

- Clean paint brushes and tools covered with water-based paints in sinks connected to sanitary sewers or in portable containers that can be dumped into a sanitary sewer drain. Brushes and tools covered with non-water-based paints, finishes, or other materials must be cleaned in a manner that enables collection of used solvents (e.g., paint thinner, turpentine, etc.) for recycling or proper disposal.
- Properly dispose of wash water, sweepings, and sediments.
- Properly store equipment, chemicals, and wastes.
- Do not dump any toxic substance or liquid waste on the pavement, the ground, or toward a storm drain.

OPTIONAL:

- Recycle residual paints, solvents, lumber, and other materials to the maximum extent practicable

4. **Employ soil erosion and stabilization techniques when exposing large areas of soil.**
    - Confine excavated materials to pervious surfaces away from storm drain inlets, sidewalks, pavement, and ditches. Material must be covered if rain is expected.
    - Use chemical stabilization or geosynthetics to stabilize bare ground surfaces.
5. **Store toxic material under cover when not in use and during precipitation events.**
6. **Properly dispose of fluids from air conditioning, cooling tower, and condensate drains.**
7. **Regularly inspect air emission control equipment under AQMD permit.**
8. **Switch to non-toxic chemicals for maintenance when possible.**
    - If cleaning agents are used, select biodegradable products whenever feasible
    - Consider using a waterless and non-toxic chemical cleaning method for graffiti removal (e.g. gels or spray compounds).
9. **Use chemicals that can be recycled.**
    - Buy recycled products to the maximum extent practicable

Training

1. **Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.**
2. **Train employees on proper spill containment and cleanup.**
    - Establish training that provides employees with the proper tools and knowledge to immediately begin cleaning up a spill.
    - Ensure that employees are familiar with the site's spill control plan and/or proper spill cleanup procedures.
    - BMP IC17 discusses Spill Prevention and Control in detail.
3. **Establish a regular training schedule, train all new employees, and conduct annual refresher training.**
4. **Use a training log or similar method to document training.**

Stencil storm drains

Storm drain system signs act as highly visible source controls that are typically stenciled directly adjacent to storm drain inlets. Stencils should read "No Dumping Drains to Ocean".

IC10. OUTDOOR LOADING/UNLOADING OF MATERIALS

Best Management Practices (BMPs)

A BMP is a technique, measure or structural control that is used for a given set of conditions to improve the quality of the stormwater runoff in a cost effective manner[1]. The minimum required BMPs for this activity are outlined in the box to the right. Implementation of pollution prevention/good housekeeping measures may reduce or eliminate the need to implement other more costly or complicated procedures. Proper employee training is key to the success of BMP implementation.

MINIMUM BEST MANAGEMENT PRACTICES

Pollution Prevention/Good Housekeeping

- Park vehicles and conduct loading/unloading only in designated loading/unloading areas so that spills or leaks can be contained.
- Clean loading/unloading areas regularly to remove potential sources of pollutants.
- Reduce exposure of materials to rain.
- Use drip pans underneath hose and pipe connections and other leak-prone spots during liquid transfer operations, and when making and breaking connections.
- Inspect equipment regularly.
- If possible, conduct loading and unloading in dry weather.

Stencil storm drains

Training

- Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.
- Provide on-going employee training in pollution prevention.

The BMPs outlined in this fact sheet target the following pollutants:

Targeted Constituents	
Sediment	x
Nutrients	x
Floatable Materials	
Metals	x
Bacteria	
Oil & Grease	x
Organics & Toxicants	x
Pesticides	x
Oxygen Demanding	

Provided below are specific procedures associated with each of the minimum BMPs along with procedures for additional BMPs that should be considered if this activity takes place at a facility located near a sensitive waterbody. In order to meet the requirements for medium and high priority facilities, the owners/operators must select, install and maintain appropriate BMPs on site. Since the selection of the appropriate BMPs is a site-specific process, the types and numbers of additional BMPs will vary for each facility.

1. **Properly design loading/unloading areas to prevent storm water runon, runoff of spills, etc.**
   - Grade and/or berm the area to prevent runon.
   - Position roof downspouts to direct stormwater away from the area.
   - Grade and/or berm the loading/unloading area to a drain that is connected to a dead-end.
   - The area where truck transfers take place should be paved. If the liquid is reactive with the asphalt, Portland cement should be used to pave the area.
   - Avoid placing loading/unloading areas near storm drains.
2. **Park vehicles and conduct loading/unloading only in designated loading/unloading areas so that spills or leaks can be contained.**
3. **Clean loading/unloading areas regularly to remove potential sources of pollutants.** This includes outside areas that are regularly covered by containers or other materials.
4. **Reduce exposure of materials to rain.**
   - Cover the loading/unloading areas.
   - If a cover is unfeasible, use overhangs, or seals or door skirts to enclose areas.
5. **Use drip pans underneath hose and pipe connections and other leak-prone spots during liquid transfer operations, and when making and breaking connections.**

---

[1] EPA " *Preliminary Data Summary of Urban Stormwater Best Management Practices"*

6. Inspect equipment regularly
    - Designate a responsible party to check under delivery vehicles for leaking fluids, spilled materials, debris, or other foreign materials.
    - Check loading/unloading equipment regularly for leaks.
7. If possible, conduct loading and unloading in dry weather.

Training

1. Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.
2. Train employees on proper spill containment and cleanup.
    - Establish training that provides employees with the proper tools and knowledge to immediately begin cleaning up a spill.
    - Ensure that employees are familiar with the site's spill control plan and/or proper spill cleanup procedures.
    - BMP IC17 discusses Spill Prevention and Control in detail.
3. Train employees on the proper techniques used during liquid transfers to avoid leaks and spills.
4. Train forklift operators on the proper loading and unloading procedures.
5. Establish a regular training schedule, train all new employees, and conduct annual refresher training.
6. Use a training log or similar method to document training.

Stencil storm drains

Storm drain system signs act as highly visible source controls that are typically stenciled directly adjacent to storm drain inlets. Stencils should read "No Dumping Drains to Ocean".

IC15. PARKING AND STORAGE AREA MAINTENANCE

Best Management Practices (BMPs)

A BMP is a technique, measure or structural control that is used for a given set of conditions to improve the quality of the stormwater runoff in a cost effective manner[1]. The minimum required BMPs for this activity are outlined in the box to the right. Implementation of pollution prevention/good housekeeping measures may reduce or eliminate the need to implement other more costly or complicated procedures. Proper employee training is key to the success of BMP implementation.

MINIMUM BEST MANAGEMENT PRACTICES

Pollution Prevention/Good Housekeeping

- Conduct regular cleaning.
- Properly collect and dispose of wash water.
- Keep the parking and storage areas clean and orderly.
- Use absorbent materials and properly dispose of them when cleaning heavy oily deposits.
- When conducting surface repair work cover materials and clean paintbrushes and tools appropriately.

Stencil storm drains

Training

- Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.
- Provide on-going employee training in pollution prevention.

The BMPs outlined in this fact sheet target the following pollutants:

Targeted Constituents	
Sediment	x
Nutrients	x
Floatable Materials	x
Metals	x
Bacteria	x
Oil & Grease	x
Organics & Toxicants	x
Pesticides	x
Oxygen Demanding	x

Provided below are specific procedures associated with each of the minimum BMPs along with procedures for additional BMPs that should be considered if this activity takes place at a facility located near a sensitive waterbody. In order to meet the requirements for medium and high priority facilities, the owners/operators must select, install and maintain appropriate BMPs on site. Since the selection of the appropriate BMPs is a site-specific process, the types and numbers of additional BMPs will vary for each facility.

1. **Conduct regular cleaning.**
   - Sweeping or vacuuming the parking facility is encouraged over other methods.
   - Sweep all parking lots at least once before the onset of the wet season.
   - Establish frequency of sweeping based on usage and field observations of waste accumulation.
2. **Properly collect and dispose of wash water.**
   - Block the storm drain or contain runoff.
   - Wash water should be collected and pumped to the sanitary sewer or discharged to a pervious surface, do not allow wash water to enter storm drains. DO NOT discharge wash water to sanitary sewer until contacting the local sewer authority to find out if pretreatment is required.
   - Dispose of parking lot sweeping debris and dirt at a landfill.
3. **Consider use of source treatment BMPs to treat runoff.**
   - Allow sheet runoff to flow into biofilters (vegetated strip and swale) and/or infiltration devices.
   - Utilize sand filters or oleophilic collectors for oily waste in low quantities.
4. **Keep the parking and storage areas clean and orderly.**

[1] EPA " *Preliminary Data Summary of Urban Stormwater Best Management Practices*"

- Clean out and cover litter receptacles frequently to prevent spillage.
- Remove debris in a timely fashion.

OPTIONAL:

- Post "No Littering" signs.

5. **When cleaning heavy oily deposits:**
   - If possible, clean oily spots with absorbent materials.
   - Do not allow discharges to the storm drain.
   - Appropriately dispose of spilled materials and absorbents.
6. **When conducting surface repair work:**
   - Pre-heat, transfer or load hot bituminous material away from storm drain inlets.
   - Conduct surface repair work during dry weather to prevent contamination from contacting stormwater runoff.
   - Cover and seal nearby storm drain inlets (with waterproof material or mesh) and manholes before applying seal coat, slurry seal, etc. Leave covers in place until job is complete and clean any debris for proper disposal.
   - To avoid runoff, use only as much water as necessary for dust control.
   - Use drip pans or absorbent material to catch drips from paving equipment that is not in use. Dispose of collected material and absorbents properly.
7. **Conduct inspections on a regular basis.**
   - Designate personnel to conduct inspections of the parking facilities and stormwater conveyance systems associated with them.
   - Inspect cleaning equipment/sweepers for leaks on a regular basis.
8. **Keep accurate maintenance logs to evaluate materials removed/stored and improvements made.**
9. **Arrange rooftop drains to prevent drainage directly onto paved surfaces.**

Training

1. **Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.**
2. **Train employees on proper spill containment and cleanup.**
   - Establish training that provides employees with the proper tools and knowledge to immediately begin cleaning up a spill.
   - Ensure that employees are familiar with the site's spill control plan and/or proper spill cleanup procedures.
   - BMP IC17 discusses Spill Prevention and Control in detail.
3. **Provide regular training to field employees and/or contractors regarding cleaning of paved areas and proper operation of equipment.**
4. **Establish a regular training schedule, train all new employees, and conduct annual refresher training.**
5. **Use a training log or similar method to document training.**

Stencil storm drains

Storm drain system signs act as highly visible source controls that are typically stenciled directly adjacent to storm drain inlets. Stencils should read "No Dumping Drains to Ocean".

IC21. WASTE HANDLING AND DISPOSAL

Best Management Practices (BMPs)

A BMP is a technique, measure or structural control that is used for a given set of conditions to improve the quality of the stormwater runoff in a cost effective manner[1]. The minimum required BMPs for this activity are outlined in the box to the right. Implementation of pollution prevention/good housekeeping measures may reduce or eliminate the need to implement other more costly or complicated procedures. Proper employee training is key to the success of BMP implementation.

MINIMUM BEST MANAGEMENT PRACTICES

Pollution Prevention/Good Housekeeping

- Prevent waste materials from coming in direct contact with wind or rain. .
- Keep waste collection areas clean.
- Secure solid waste containers when not in use.
- Regularly inspect, repair, and/or replace waste containers.
- Use all of a product before disposing of the container.
- Label and store hazardous wastes according to hazardous waste regulations.

Stencil storm drains

Training

- Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.
- Provide on-going employee training in pollution prevention.

The BMPs outlined in this fact sheet target the following pollutants:

Targeted Constituents	
Sediment	x
Nutrients	x
Floatable Materials	x
Metals	x
Bacteria	x
Oil & Grease	x
Organics & Toxicants	x
Pesticides	x
Oxygen Demanding	x

Provided below are specific procedures associated with each of the minimum BMPs along with procedures for additional BMPs that should be considered if this activity takes place at a facility located near a sensitive waterbody. In order to meet the requirements for medium and high priority facilities, the owners/operators must select, install and maintain appropriate BMPs on site. Since the selection of the appropriate BMPs is a site-specific process, the types and numbers of additional BMPs will vary for each facility.

1. **Prevent waste materials from coming in direct contact with wind or rain.**
   - Cover the waste management area with a permanent roof.
   - If this is not feasible, cover waste piles with temporary covering material such as reinforced tarpaulin, polyethylene, polyurethane, polypropylene, or hypalon.
   - Cover dumpsters to prevent rain from washing out waste materials.
2. **Design waste handling and disposal area to prevent stormwater runon.**
   - Enclose the waste handling and disposal area or build a berm around it.
   - Position roof downspouts to direct stormwater away from waste handling and disposal area.
3. **Design waste handling and disposal area to contain spills.**
   - Place dumpsters or other waste receptacles on an impervious surface.
   - Construct a berm around the area to contain spills.
   - Install drains connected to the public sewer or the facility's process wastewater system within these contained areas. **DO NOT** discharge to a public sewer until contacting the local sewer authority to find out if pretreatment is required.

[1] EPA " *Preliminary Data Summary of Urban Stormwater Best Management Practices*"

4. Keep waste collection areas clean.
    - When cleaning around waste handling and disposal areas use dry methods when possible (e.g. sweeping, use of absorbents).
    - If water must be used, collect water and discharge to the sewer if permitted to do so. DO NOT discharge to a public sewer until contacting the local sewer authority to find out if pretreatment is required. If discharge to the sanitary sewer is not allowed, pump water to a tank and dispose of properly.
    - Post "No Littering" signs.
5. Secure solid waste containers when not in use.
6. Regularly inspect, repair, and/or replace waste containers.
7. Do not fill waste containers with washout water or any other liquid.
8. Use all of a product before disposing of the container.
9. Segregate wastes by type and label and date wastes.
    - Do not mix wastes; this can cause chemical reactions, make recycling impossible, and complicate disposal.
    - Ensure that only appropriate solid wastes are added to solid waste containers.
    - Certain wastes such as hazardous wastes, appliances, fluorescent lamps, pesticides, etc. may not be disposed of in solid waste containers.
10. Label and store hazardous wastes according to hazardous waste regulations.
    - Consult your local hazardous waste agency or Fire Department for details.
    - Obtain a hazardous waste generator license or permit if necessary.
12. Minimize waste.
    - Recycle materials whenever possible.
    - Modify processes or equipment to increase efficiency.
    - Identify and promote use of non-hazardous alternatives.
    - Reduction in the amount of waste generated can be accomplished using many different types of source controls such as:
        - Production planning and sequencing
        - Process or equipment modification
        - Raw material substitution or elimination
        - Loss prevention and housekeeping
        - Waste segregation and separation
        - Close loop recycling
    - Establish a material tracking system to increase awareness about material usage. This may reduce spills and minimize contamination, thus reducing the amount of waste produced.

Training

1. Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.
2. Train employees in proper waste handling and disposal.
3. Train employees on proper spill containment and cleanup.
    - Establish training that provides employees with the proper tools and knowledge to immediately begin cleaning up a spill.
    - Ensure that employees are familiar with the site's spill control plan and/or proper spill cleanup procedures.
    - BMP IC17 discusses Spill Prevention and Control in detail.

4. Establish a regular training schedule, train all new employees, and conduct annual refresher training.
5. Use a training log or similar method to document training.

Stencil storm drains

Storm drain system signs act as highly visible source controls that are typically stenciled directly adjacent to storm drain inlets. Stencils should read "No Dumping Drains to Ocean".

IC22. EATING AND DRINKING ESTABLISHMENTS

Best Management Practices (BMPs)

A BMP is a technique, measure or structural control that is used for a given set of conditions to improve the quality of the stormwater runoff in a cost effective manner[1]. The minimum required BMPs for this activity are outlined in the box to the right. Implementation of pollution prevention/good housekeeping measures may reduce or eliminate the need to implement other more costly or complicated procedures. Proper employee training is key to the success of BMP implementation.

MINIMUM BEST MANAGEMENT PRACTICES

Pollution Prevention/Good Housekeeping

- Use dry cleaning methods instead of water
- Clean equipment (floor mats, grease filters, grills, garbage cans, etc.) indoors or in a covered outdoor wash area that is plumbed to the sanitary sewer or in an area that will contain the wash water.
- Recycle and/or properly dispose of grease and oil.
- Block the storm drain when hosing or steam/pressure washing outside dumpster areas, sidewalks, and common areas.

Stencil storm drains

Training

- Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.
- Provide on-going employee training in pollution prevention.

The BMPs outlined in this fact sheet target the following pollutants:

Targeted Constituents	
Sediment	
Nutrients	x
Floatable Materials	x
Metals	
Bacteria	x
Oil & Grease	x
Organics & Toxicants	x
Pesticides	x
Oxygen Demanding	x

Provided below are specific procedures associated with each of the minimum BMPs along with procedures for additional BMPs that should be considered if this activity takes place at a facility located near a sensitive waterbody. In order to meet the requirements for medium and high priority facilities, the owners/operators must select, install and maintain appropriate BMPs on site. Since the selection of the appropriate BMPs is a site-specific process, the types and numbers of additional BMPs will vary for each facility.

1. **Practice good housekeeping.**
   - Conduct regular sweeping or vacuuming of outdoor areas: Dry sweep pavement areas including "drive-thru" areas, parking lots, sidewalks, outdoor eating areas and dumpster storage areas frequently.
   - Keep outside areas free of trash & debris.
   - Do not hose out dumpsters or fill them with liquid waste.
   - Regularly inspect, repair, and/or replace dumpsters.
2. **Clean equipment (floor mats, grease filters, grills, garbage cans, etc.) indoors or in a covered outdoor wash area that is plumbed to the sanitary sewer.**
   - Clean equipment in a mop sink if possible (never in a food preparation sink). If there is no mop sink, dedicate an indoor cleaning area where a drain is plumbed to the sanitary sewer.
   - Dispose mop water from cleaning floors in a mop sink, toilet or other drain that is plumbed to the sanitary sewer.
   - Do not pour wash water outside or into a street, gutter, or storm drain.
   - Dispose of all wastewater containing oil and grease in a grease trap or interceptor.

[1] EPA " *Preliminary Data Summary of Urban Stormwater Best Management Practices"*

3. **Recycle and/or properly dispose of grease and oil.** Collect and dispose of concentrated waste oil and grease and disposed of by a certified waste grease hauler. NEVER pour grease or oil into a sink, floor drain, storm drain or dumpster.
4. **Block storm drain(s) when cleaning (hosing or steam/pressure washing) outside dumpster areas, sidewalks, and common areas with hot water, soap, or other cleaning agent.** Collect water/waste and discharge to the sanitary sewer (with approval of the local sanitation district).

Training

1. **Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.**
2. **Train employees on proper spill containment and cleanup.**
    - Establish training that provides employees with the proper tools and knowledge to immediately begin cleaning up a spill.
    - Ensure that employees are familiar with the site's spill control plan and/or proper spill cleanup procedures.
    - BMP IC17 discusses Spill Prevention and Control in detail.
3. **Establish a regular training schedule, train all new employees, and conduct annual refresher training.**
4. **Use a training log or similar method to document training.**

Stencil storm drains

Storm drain system signs act as highly visible source controls that are typically stenciled directly adjacent to storm drain inlets. Stencils should read "No Dumping Drains to Ocean".

APPENDIX B

CONDITIONS OF APPROVAL,

RESOLUTION NO. PC –09-29 RESOLUTION OF THE PLANNING COMMISSION OF THE CITY OF BREA APPROVING PRECISE DEVELOPMENT NO. PD 09-01, CONDITIONAL USE PERMIT NO. CUP 09-14, AND ADOPTING MITIGATED NEGATIVE DECLARATION NO. ND 08-01.

ADOPTED AND APPROVED, DECEMBER 8, 2009

City of Brea

December 9, 2009

Architects Orange
144 N. Orange St.
Orange, CA 92866

RE: **APPROVAL:** Meeting Date: December 9, 2009
REQUEST: Precise Development No. PD 09-01, Conditional Use Permit No. 09-14, and addendum to Mitigated Negative Declaration No. ND 08-01
ADDRESS: NWC Imperial Highway and Associated Road

Dear Applicant:

Your application for the above-referenced matter was considered on the above date. The Planning Commission has approved the request subject to conditions of Resolution No. PC 09-29, a copy of which is enclosed for your file.

Please review the Resolution of Approval. If you have any questions, please contact us immediately.

As a reminder, there is a period of ten (10) days in which the Planning Commission's decision may be appealed to the City Council. During that time, no permits or action shall be taken. All work must be accomplished within the time frame(s) as stated in the resolution.

If we may be of further assistance, please do not hesitate to contact us at (714) 990-7674.

Sincerely,

David M. Crabtree, AICP
City Planner

Letter to Applicant

Enclosure:
Resolution of Approval

City Council **John Beauman** *Mayor* **Ron Garcia** *Mayor Pro Tem* **Roy Moore** *Councilmember* **Don Schweitzer** *Councilmember* **Marty Simonoff** *Councilmember*

RESOLUTION NO. PC 09-29

A RESOLUTION OF THE PLANNING COMMISSION OF THE CITY OF BREA APPROVING PRECISE DEVELOPMENT NO. PD 09-01, CONDITIONAL USE PERMIT NO. CUP 09-14, AND ADOPTING ADDENDUM TO MITIGATED NEGATIVE DECLARATION NO. ND 08-01, SUBJECT TO CONDITIONS AS SET FORTH HEREIN, AS AMENDED

A. RECITALS.

(i) **WHEREAS,** the Planning Commission of the City of Brea has heretofore held a duly noticed public hearing, as required by law, on Precise Development No. PD 09-01, Conditional Use Permit No. CUP 09-14, and Addendum to Mitigated Negative Declaration No. ND 08-01, a request to expand the existing Brea Plaza retail center with the construction of five new buildings, two new drive-through food uses, the demolition of three structures, and the construction of an improved parking lot over the Loftus Channel, and a new sign program in the C-G (PD), General Commercial (Precise Development) zone.

(ii) **WHEREAS,** the project proponent is: Architects Orange, 144 North Orange Street, Orange, CA 92866.

(iii) **WHEREAS,** the subject property is generally located at the northwest corner of Imperial Highway and Associated Road, in the City of Brea, and legally described as a parcels 1 through 13 of Parcel Map 9-76, as recorded in Book 205, pages 17 through 19 of Parcel Maps, as shown in the latest rolls of the County of Orange Tax Assessor.

(iv) **WHEREAS,** the property is zoned General Commercial/Precise Development (C-G/PD) and designated as General Commercial in the General Plan land use element.

(v) **WHEREAS,** all legal prerequisites to the adoption of this Resolution have occurred.

B. RESOLUTION.

NOW, THEREFORE, BE IT FOUND, DETERMINED, AND RESOLVED, by the Planning Commission of the City of Brea, as follows:

1. In all respects as set forth in Recitals, Part A, of this Resolution.

2. The applications for the location set forth are authorized by Section 20.236, Section 20.260, Section 18.204, and Section 20.408.030, of the Brea Zoning Ordinance, as amended.

3. The Planning Commission further finds, as follows:

a. Finding: The site is adequate in size and shape to accommodate the proposal.

Fact: As proposed, the project will meet all development standards of the General Commercial zone including building height, setbacks, allowable lot coverage, and parking.

b. Finding: The site relates to streets and highways which are properly designed to carry the type and quantity of traffic generated by the proposed development.

Fact: The site is located on Imperial Highway and adjacent to State Route 57 Freeway. The Addendum to Mitigated Negative Declaration No. ND 08-01 found that no significant traffic impacts are expected as a result of the proposed project.

c. Finding: The proposed project, with conditions as imposed, is desirable for the development of the community and furthers the various elements of the General Plan.

Fact: Brea Plaza currently consists of major tenant retail buildings, restaurants, and various outpads. The proposed project will construct three additional buildings, box in the Loftus Channel and construct a parking lot and bio-swale over the top of the reconstructed channel. Three existing buildings will be demolished. The addition of the parking will increase the parking ratio of the site and the boxing in of the Loftus Channel and surface improvements will provide an aesthetic improvement for the east side of the shopping center. The bio-swale will prove beneficial by filtering storm water before it enters the Flood Channel.

d. Finding: That the use(s) applied for at the location set forth in the application is properly one(s) for which a Conditional Use Permit is authorized by this title.

Fact: The Conditional Use Permit will allow for a drive-through food use in a General Commercial Zone. Additionally, the Conditional Use Permit is required to replace the master sign program for the shopping center.

e. Finding: That with the conditions stated in the permit, the uses will not adversely affect the public, health, safety, or general welfare.

Fact: The Conditional Use Permit will allow for a drive-through food use in a General Commercial Zone. The Conditional Use Permit will bring the aesthetic improvements to the streetscape along Associated Road and

establishment of new businesses within the site. The proposed construction within the Loftus channel has been properly engineered and designed so no flooding impacts will occur.

4. The Planning Commission hereby finds that the Addendum to Mitigated Negative Declaration No. ND 08-01 has been prepared in compliance with the California Environmental Quality Act of 1970, as amended, and the Guidelines promulgated thereunder, and further, this Commission has reviewed and considered the information contained in the Addendum to Mitigated Negative Declaration No. ND 08-01 with respect to the project identified in this Resolution. The Planning Commission hereby specifically finds and determines that, based upon the findings set forth below, and changes and alterations which have been incorporated into and conditioned upon the proposed project, no significant adverse environmental effects will occur. The Planning Commission hereby finds that facts supporting the above specified findings are contained in the Addendum to Mitigated Negative Declaration, the staff report and exhibits, and the information provided to this Commission during the public hearing conducted with respect to the project and the Addendum to Mitigated Negative Declaration.

5. Precise Development No. PD 09-01 and Conditional Use Permit No. CUP 09-14 are hereby approved, subject to conditions as set forth herein:

a) Development shall occur in substantial conformance with the plans within Exhibit "A" and "B" to the staff report, the exhibits displayed at the public hearing, the information presented to the Planning Commission on file in the Planning Division, the conditions contained herein, and all applicable City regulations.

b) The applicant shall provide a digital copy of the conceptual plan set to the Planning Division.

c) All mitigation measures contained in the Mitigation Monitoring Program of the Mitigated Negative Declaration No. ND 08-01 shall be implemented to the satisfaction of the City Planner, City Engineer, and the Building and Safety Manager.

d) The applicant shall submit a Construction Phasing Plan prior to issuance of the grading permit. Said Plan shall entail the construction traffic circulation plan, fencing, staging/storage, and parking. The Construction Phasing Plan shall be subject to the review and approval of the City Engineer, Building and Safety Manager, Fire Marshal, and City Planner.

e) The existing reciprocal parking agreement with the adjacent property to the north shall be maintained. The applicant shall provide a parking management plan, consistent with the Kimley-Horn parking analysis dated November 16, 2009, for the review and approval of the City Planner prior to the occupancy of the first expansion building (new construction). Said plan shall specifically address and provide strategies for issues including, but not limited to, employees parking, any tenant assigned parking, any time-limited parking, as well as a process for a contingency parking plan should any future parking impacts from any individual or cumulative tenants(s) create a need for site parking modifications. Said contingency plan shall provide a remedy for any Brea Plaza parking impacts to nearby residential neighbors, should they ever occur. A copy of the parking management plan shall be provided to all tenants and shall include a mandate for compliance.

f) The applicant shall work in good faith with the City to provide City of Brea identification signage/improvements near the main Imperial Highway project entrance and visible to vehicles exiting the north bound Route 57 freeway at Imperial Highway. A design and schedule for implementation shall be submitted for the review and approval of the City Planner prior to the final tenant occupancy for the final project phase, as identified in the required phasing plans. Goals for identification shall include providing a design integral to the shopping center, effecting a pleasing streetscape, and providing a welcoming statement to the City of Brea to the motorist exiting the 57 freeway.

g) Trail improvements shall be provided along Associated Road consistent with the routing of the Master Plan of Trails in the General Plan. At minimum, said improvements shall include one hard surface (e.g. concrete) trail tread and one decomposed granite, or acceptable alternate material, trail tread. Final trail alignment details shall be provided for the review and approval of the Community Services Director.

h) The applicant shall dedicate an easement for the sidewalk and trail on the west side of Associated Road from Imperial Highway to the northern property line to allow for future extension to the north of the site.

i) Final sidewalk and trails designs along Associated Road shall be subject to the review and approval on the City Engineer prior to the issuance of a grading permit.

j) Final drive-thru design for Building "P" shall be subject to the review and approval on the City Engineer prior to the issuance of a grading permit.

k) Final drive aisle width northeast of Building "G" shall be subject to the review and approval by the City Engineer prior to the issuance of a grading permit.

l) The applicant shall provide loading areas for Buildings "P" and "L."

m) All trash storage and related equipment shall be fully screened from public view. Such screening shall be architecturally compatible with the main building, subject to the review and approval of the City Planner.

n) The drive thru service lanes for Building T are located within the City's sublease area and shall be for the exclusive use of the tenant occupying said Building T. Details for menu boards, overhead clearance signage, and other similar improvements for the drive thru service lanes for both Buildings P and T shall be subject to the review and approval of the City Planner prior to occupancy.

o) All signage shall be consistent with the revised sign criteria for Brea Plaza, dated December 8, 2009. Signs shall be comprised of individual channel elements with no exposed wiring or raceways, subject to the review and approval of the City Planner. No cabinet signs shall be allowed.

p) The applicant shall provide a detailed final landscaping and full coverage irrigation plan. Said landscaping and irrigation plan shall be reviewed and approved by the City Planner prior to the issuance of any building permits.

q) Final landscaping plans shall incorporate the City designated street tree Pyrus Callleryany "Redspire" for Imperial Highway. A minimum of 50% of trees shall consist of 36" and 48" box trees to enhance the landscaping mix. Approved landscaping and irrigation shall be installed prior to a Certificate of Occupancy being issued for any building. All landscaping and irrigation shall comply with the provisions of the City's Water Conserving Landscape Ordinance No. 932.

r) Final grading and drainage plans shall be submitted for the review and approval of the City Engineer and City Planner prior to the issuance of grading permits.

s) The applicant shall provide an erosion control plan, incorporating measures contained in the SWPPP prior to issuance of a grading/demolition permit, subject to the review and approval of the City Engineer.

t) The applicant shall prepare and provide a WQMP incorporating both construction and post construction pollution prevention controls for the entire site, prior to the issuance of a grading/demolition permit and subject to the review and approval of the City Engineer.

u) All on-site utilities shall be located underground, subject to the review and approval of the City Engineer.

v) All off-site improvements shall be submitted to the Engineering Division for review and approval prior to the issuance of building permits.

w) The applicant shall obtain applicable permits and approval from the City Engineer for the removal and installation of new driveway aprons.

x) The applicant shall be required to suspend excavation and grading, and notify the Engineering Division, if unusual soil odors, soil staining, color or soil texture, or other characteristics indicate that isolated soil contamination or buried containers are found during grading.

y) These conditions shall be listed in their entirety on the title sheet of the final construction plans.

z) The applicant shall pay a Notice of Determination Posting fee (check made for $50.00 payable to the County of Orange) to the Planning Division within three (3) business days of this approval.

6. The Secretary of this Commission shall certify to the adoption of this Resolution.

ADOPTED AND APPROVED this 8th day of December, 2009.

_____
Chairman, Planning Commission

I, David Crabtree, Secretary to the Planning Commission of the City of Brea, do hereby certify that the foregoing Resolution was introduced at a regular meeting of the Planning Commission of the City of Brea held on the 8th day of December, 2009, and was finally passed at a regular meeting of the Planning Commission of the City of Brea, held on the 8th day of December, 2009, by the following votes:

AYES:	COMMISSIONERS:	Clough, Koos, Fox, Grosse, Prenovost

Subject: Extension of Lake or Streambed Alteration Agreement
Notification No. 1600-2008-0029-R5
Loftus Channel Improvements

Dear Mr. Harris:

The Department of Fish and Game ("Department") received your request to extend Lake or Streambed Alteration Agreement ("Agreement") and extension fee, for the above referenced agreement. The Department hereby grants your request to extend the Agreement from December 31, 2009, to December 31, 2012. All other conditions in the original Agreement remain in effect.

Copies of the original Agreement and this letter must be readily available at project worksites and must be presented when requested by a Department representative or other agency with inspection authority.

If you have any questions regarding this matter, please contact me at (858) 467-4207 or kfisher@dfg.ca.gov.

Sincerely,

Kelly Fisher

DEPARTMENT OF FISH AND GAME

REQUEST TO EXTEND

LAKE OR STREAMBED ALTERATION AGREEMENT

Complete EACH field and attach additional pages if necessary. Please refer to the fee schedule and submit the correct fee with extension request.

1. APPLICANT REQUESTING EXTENSION

If the applicant is a business, agency, or utility, please include the name of the applicant's representative, who should be an employee of the applicant.

Name	California Brea Partners, L.P.		
Business/Agency			
Street Address	719 Griswold Street, Suite 280		
City, State, Zip	Detroit, MI 48226		
Telephone	(313) 963-3678	Fax	(313) 442-9919
Email	mharris@bosc.com or wnadhir@bosc.com		

2. PROJECT INFORMATION

Agreement number	1600-2008-0029-R5
Original expiration date	12/31/09
New expiration date requested	12/31/12

Specify: 1) the work that has been completed; 2) the work that needs to be completed; and 3) the amount of time needed to complete the work.

1) No work completed to date.

2) Entire scope as set forth in "Project Description" of the Agreement.

3) Three (3) years is requested due to the uncertainty within the national economy, and the difficulty this presents in obtaining financing for the Project, and completing the work.

☐ Continued on additional page(s)

REQUEST TO EXTEND LAKE OR STREAMBED ALTERATION AGREEMENT

2. PROJECT INFORMATION, continued.

Specify the reason(s) for the extension request
The overall declining state of both the US economy, and that of California, and specifically the collapse of the banking and financing markets, resulted in a prolonged period in all of 2008, and most of 2009 where there was a complete cessation of lending activities for construction projects. The financing we had originally arranged for this work was cancelled, and we have faced extreme hardships in identifying alternative sources of financing. At present, we are in pursuing several different options, and are in discussions with several entities which have expressed an interest in providing the necessary capital for completing this important work; however, no agreements have been entered into and finalized as of this date. We are aggressively pursuing such opportunities, and are fully resolved to complete this project; however cannot state with certainty when we will be able to commence Project activities. The extra time requested for an extension (3 years) will therefore accomodate any unforseen prolonged weakness in the economy, and hopefully provide sufficient time for a recovery of the economy and a resumption of lending for these types of projects. ☐ Continued on additional page(s)

Note: The Department may not process this extension request until the extension fee has been received.

3. SIGNATURE

I hereby certify that to the best of my knowledge the information in this extension request ("request") is true and correct and that I am authorized to sign this request as, or on behalf of, the applicant. I understand that if any information in this request is found to be untrue or incorrect, the Department may suspend processing this request. I understand also that if any information in this request is found to be untrue or incorrect, I and/or the applicant may be subject to civil or criminal prosecution.

Marc Harris — Signature of Applicant or Applicant's Authorized Representative

Oct. 29, 2009 — Date

Subject: RE: Loftus Channel - Agreement 1600-2008-0029-R5

Mr. James Palda,

The Department of Fish and Game accepts the proposed minor change to the original Streambed Alteration Agreement (SAA) No. 1600-2008-0029-R5. The original SAA notes the use of "Katchall Baffle Filters" in the project description. Katchall Baffle will be replaced with Bio Clean.

Thank you.

Pursuant to the Governor's Executive Order S-12-10, I am required to take three furlough days per month.

>>> James Palda <jpalda@SteadfastCcompanies.com> 1/27/2011 1:42 PM >>>
Padmini, Thank you.

Russell,

Attached is our existing agreement. We've changed the bio filter manufacturer to a group called Bio Clean. On page 3 of the agreement it says "Katchall Filters". I need that revised to Bio Clean. It's the same type of filter device, just a different manufacturer. This revision has been approved by Adam Fisher of Regional Water Quality Control Board and City of Brea.

If you need any additional information, please let me know. Email approval will suffice.

Thank you,

James Palda

Mr. Palda

Sorry for not returning your call/email earlier. I was out of the office yesterday. I have forwarded your request to amend the agreement to the Environmental Scientist, Russell Barabe, who handles the area now. He will be contacting you. He can be reached at 858 467 2717 or via email at rbarabe@dfg.ca.gov.

Please email me if you have any other questions.

Thank you.

>>> James Palda <jpalda@SteadfastCcompanies.com> 1/25/2011 5:22 PM >>>
T need to change two words on page 3 of 9 on the agreement to read BioClean instead of atchall Baffle filters. The city of Brea and WGRCB have approved the change for the WQMP, however won't sign off until you can approve (via email correspondence is fine).

Please review and call me at your earliest convenience.

Thank you,

LOS ANGELES DISTRICT
U.S. ARMY CORPS OF ENGINEERS

DEPARTMENT OF THE ARMY PERMIT

Permittee: Bosc Equities, LLC; Waad Nadhir

Permit Number: SPL-2008-00232-JPL

Issuing Office: Los Angeles District

Note: The term "you" and its derivatives, as used in this permit, means the permittee or any future transferee. The term "this office" refers to the appropriate district or division office of the Corps of Engineers having jurisdiction over the permitted activity or the appropriate official acting under the authority of the commanding officer.

You are authorized to perform work in accordance with the terms and conditions specified below.

Project Description: To permanently discharge fill onto 0.628 acre of waters of the U.S., in association with the Orange County Loftus Channel Improvement project as shown on the attached drawings.

Specifically, you are authorized to place an approximately 780 linear foot segment of the Brea Loftus channel into an underground box culvert, permanently impacting 0.628 acre of jurisdictional wetlands in order to install additional parking places, a water quality bio swale, a new greenbelt walkway, and upgraded access points as part of the commercial development improvement project.

Project Location: The proposed Orange County Loftus Channel Improvement project site consists of approximately 0.628 acre of jurisdictional waters of the U.S. and is located directly adjacent to the western side of Associated Road and is bound to the south by Imperial Highway (Highway 90) and is bordered to the west by Brea Plaza shopping center within the City of Brea, Orange County, California. The project site begins approximately 780 feet upstream from the northwest corner of Imperial Highway and Associated Road. The coordinates for the approximate center of the project site are lat: 33.7027141351463, lon: -117.760914143404.

Permit Conditions:

General Conditions:

1. The time limit for completing the authorized activity ends on February 6, 2012. If you find that you need more time to complete the authorized activity, submit your request for a time extension to this office for consideration at least one month before the above date is reached.

2. You must maintain the activity authorized by this permit in good condition and in conformance with the terms and conditions of this permit. You are not relieved of this requirement if you abandon the permitted activity, although you may make a good faith transfer to a third party in compliance with General Condition 4 below. Should you wish to cease to maintain the authorized activity or should you desire to abandon it without a good faith transfer, you must obtain a modification from this permit from this office, which may require restoration of the area.

3. If you discover any previously unknown historic or archeological remains while accomplishing the activity authorized by this permit, you must immediately notify this office of what you have found. We will initiate the Federal and state coordination required to determine if the remains warrant a recovery effort or if the site is eligible for listing in the National Register of Historic Places.

4. If you sell the property associated with this permit, you must obtain the signature of the new owner in the space provided and forward a copy of the permit to this office to validate the transfer of this authorization.

5. If a conditioned water quality certification has been issued for your project, you must comply with the conditions specified in the certification as special conditions to this permit. For your convenience, a copy of the certification is attached if it contains such conditions.

6. You must allow representatives from this office to inspect the authorized activity at any time deemed necessary to ensure that it is being or has been accomplished with the terms and conditions of your permit.

Special Conditions:

1. Prior to initiating construction in waters of the U.S., and to mitigate for impacts to 0.628 acre of wetland waters of the U.S., the Permittee shall provide documentation verifying purchase of 1.92 credits for the restoration/establishment of jurisdictional wetland or riparian streambed from the San Gabriel Mountains Regional Conservancy (SGMRC) in-lieu fee program (ILFP). The Permittee shall not initiate work in waters of the U.S. prior to receiving written confirmation (by letter or e-mail) from the Corps as to compliance with this special condition. The permittee retains responsibility for providing the compensatory mitigation until the number and resource type of credits described above have been secured from a sponsor and the district engineer has received documentation that confirms that the sponsor has accepted the responsibility for providing the required compensatory mitigation. This documentation may consist of a letter or form signed by the sponsor, with the permit number and a statement indicating the number and resource type of credits that have been secured from the sponsor.

2. Prior to initiating construction in waters of the U.S., the Permittee shall submit to the Corps a complete set of final detailed grading/construction plans showing all work and structures in waters of the U.S. All plan sheets shall be signed, dated, and submitted on paper no larger than 11x17 inches. No work in waters of the U.S. is authorized until the Permittee receives, in writing (by letter or e-mail), Corps approval of the final detailed grading/construction plans. The Permittee shall ensure that the project is built in accordance with the Corps-approved plans.

3. The Permittee shall clearly mark the limits of the workspace with flagging or similar means to ensure mechanized equipment does not enter preserved waters of the U.S. and riparian wetland/habitat areas. Adverse impacts to waters of the U.S. beyond the Corps-approved construction footprint are not authorized. Such impacts could result in permit suspension and revocation, administrative, civil or criminal penalties, and/or substantial, additional, compensatory mitigation requirements.

4. Within 45 calendar days of completion of authorized work in waters of the U.S., the Permittee shall submit to the Corps a post-project implementation memo indicating the date authorized impacts to waters of the U.S. ceased.

5. This Corps permit does not authorize you to take any threatened or endangered species, or adversely modify its designated critical habitat. In order to legally take a listed species, you must have separate authorization under the Endangered Species Act (ESA) (e.g. ESA Section 10 permit, or a Biological Opinion (BO) under ESA Section 7, with "incidental take" provisions with which you must comply).

6. Pursuant to 36 C.F.R. section 800.13, in the event of any discoveries during construction of either human remains, archeological deposits, or any other type of historic property, the Permittee shall notify the Corps Archeology Staff within 24 hours (Steve Dibble at 213-452-3849 or John Killeen at 213-452-3861). The Permittee shall immediately suspend all work in any area(s) where potential cultural resources are discovered. The Permittee shall not resume construction in the area surrounding the potential cultural resources until the Corps re-authorizes project construction, per 36 C.F.R. section 800.13.

Further Information:

1. Congressional Authorities. You have been authorized to undertake the activity described above pursuant to:

( ) Section 10 of the River and Harbor Act of 1899 (33 U.S.C. 403).

(X) Section 404 of the Clean Water Act (33 U.S.C. 1344).

( ) Section 103 of the Marine Protection, Research and Sanctuaries Act of 1972 (33 U.S.C. 1413).

2. Limits of this authorization.

a. This permit does not obviate the need to obtain other Federal, state, or local authorizations required by law.

b. This permit does not grant any property rights or exclusive privileges.

c. This permit does not authorize any injury to the property or rights of others.

d. This permit does not authorize interference with any existing or proposed Federal project.

3. Limits of Federal Liability. In issuing this permit, the Federal Government does not assume any liability for the following:

a. Damages to the permitted project or uses thereof as a result of other permitted or unpermitted activities or from natural causes.

b. Damages to the permitted project or uses thereof as a result of current or future activities undertaken by or on behalf of the United States in the public interest.

c. Damages to persons, property, or to other permitted or unpermitted activities or structures caused by the activity authorized by this permit.

d. Design or construction deficiencies associated with the permitted work.

e. Damage claims associated with any future modification, suspension, or revocation of this permit.

4. Reliance on Applicant's Data. The determination of this office that issuance of this permit is not contrary to the public interest was made in reliance on the information you provided.

5. Reevaluation of Permit Decision. This office may reevaluate its decision on this permit at any time the circumstances warrant. Circumstances that could require a reevaluation include, but are not limited to, the following:

a. You fail to comply with the terms and conditions of this permit.

b. The information provided by you in support of your permit application proves to have been false, incomplete, or inaccurate (See 4 above).

c. Significant new information surfaces which this office did not consider in reaching the original public interest decision.

Such a reevaluation may result in a determination that it is appropriate to use the suspension, modification, and revocation procedures contained in 33 CFR 325.7 or enforcement procedures such as those contained in 33 CFR 326.4 and 326.5. The referenced enforcement procedures provide for the issuance of an administrative order requiring you to comply with the terms and conditions of your permit and for the initiation of legal action where appropriate. You will be required to pay for any corrective measure ordered by this office, and if you fail to comply with such directive, this office may in certain situations (such as those specified in 33 CFR 209.170) accomplish the corrective measures by contract or otherwise and bill you for the cost.

6. Extensions. General condition 1 establishes a time limit for the completion of the activity authorized by this permit. Unless there are circumstances requiring either a prompt completion of the authorized activity or a reevaluation of the public interest decision, the Corps will normally give you favorable consideration to a request for an extension of this time limit.

Your signature below, as permittee, indicates that you accept and agree to comply with the terms and conditions of this permit.

PERMITTEE

DATE 2/9/09

This permit becomes effective when the Federal official, designated to act for the Secretary of the Army, has signed below.

Mark Durham
Chief, South Coast Branch
Regulatory Division

DATE 9 Feb. 2009

When the structures or work authorized by this permit are still in existence at the time the property is transferred, the terms and conditions of this permit will continue to be binding on the new owner(s) of the property. To validate the transfer of this permit and the associated liabilities associated with compliance with its terms and conditions, have the transferee sign and date below.

September 12, 2008

Mr.Waad Nadhir
California Brea Partners, L.P.
Brea Shopping Center Suite 413
413 South Associated Road
Brea, CA 92821

Dear Mr. Nadhir:

Enclosed is Streambed Alteration Agreement # **1600-2008-0029-R5** that authorizes work on the Orange County Loftus Channel Improvements project impacting Loftus Diversion Channel, a tributary to San Gabriel River in Orange County. This action is authorized under Section 1602 of the Fish and Game Code and has been approved by the California Department of Fish and Game. Pursuant to the requirements of the California Environmental Quality Act (CEQA), the Department filed a Notice of Determination (NOD) on the project on September 12, 2008. Under CEQA regulations, the project has a 30-day statute of limitations on court challenges of the Department's approval.

The Department believes that the project fully meets the requirements of the Fish and Game Code and CEQA. However, if court challenges on the NOD are received during the 30-day period, then an additional review or even modification of the project may be required. If no comments are received during the 30-day period, then any subsequent comments need not be responded to. This information is provided to you so that if you choose to undertake the project prior to the close of the 30-day period, you do so with the knowledge that additional actions may be required based on the results of any court challenges that are filed during that period.

Please contact Naeem Siddiqui at (562) 493-6897 if you have any questions regarding the Streambed Alteration Agreement.

Sincerely,

for Helen Birss
Environmental Program Manager

Notification No.1600-2008-0029-R5

AGREEMENT REGARDING PROPOSED STREAM OR LAKE ALTERATION

THIS AGREEMENT, entered into between the State of California, Department of Fish and Game, hereinafter called the Department, and the lessee, California Brea Partners, L.P., at 719 Griswold Street, Suite 530, Detroit, MI 48226, Phone: 313-237-8901, (P.O.C. Jon Petke, 714-556-5200), hereinafter called the Applicant, is as follows:

WHEREAS, pursuant to Section 1602 of the California Fish and Game Code, the Applicant, on the 22nd day of January, 2008, notified the Department that he intend to divert or obstruct the natural flow of, or change the bed, channel, or bank of, or use material from the streambed(s) of the following water(s): Loftus Diversion Channel, tributary to San Gabriel River, Orange County, California, Section 13, Township 3S, Range 10W; USGS Map La Habra 7.5; and

WHEREAS, the Department has determined that such operations may substantially adversely affect those existing fish and wildlife resources within the vicinity of the site, specifically identified as follows: Amphibians: Pacific treefrog (*Hyla regilla*); Reptiles: side-blotched lizard (*Uta stansburiana*), and western fence lizard (*Sceloporus occidentalis*); Birds: American crow (*Corvus brachyrhynchos*), Say's phoebe (*Sayornis saya*), yellow-rumped warbler (*Dendroica coronata*), mourning dove (*Zenaida macroura*), house finch (*Carpodacus mexicanus*), snowy egret (*Egretta thula*), and great egret (*Ardea albus*); Mammals: house mouse (*Mus musculus*); Riparian vegetation which provides habitat for those species; and all other aquatic and wildlife resources in the area.

THEREFORE, the Department hereby proposes measures to protect fish and wildlife resources during the Operator's work. The Applicant hereby agrees to accept the following measures/conditions as part of the proposed work.

If the Applicant's work changes from that stated in the notification specified above, this Agreement is no longer valid and a new notification shall be submitted to the Department. Failure to comply with the provisions of this Agreement and with other pertinent code sections, including but not limited to Fish and Game Code Sections 5650, 5652, 5937, and 5948, may result in prosecution.

Nothing in this Agreement authorizes the Applicant to trespass on any land or property, nor does it relieve the Operator of responsibility for compliance with applicable Federal, State, or local laws or ordinances. A consummated Agreement does not constitute Department's endorsement of the proposed operation, or assure the Department's concurrence with permits required from other agencies.

This Agreement becomes effective the date of the Department's signature and terminates December 31, 2009, for project activities only. This Agreement shall remain in effect for that time necessary to satisfy the terms/conditions of this Agreement.

Pursuant to Section 1600 *et seq.*, the Applicant may request one extension of the Agreement; the Operator shall request the extension of this Agreement prior to its termination.

The one extension may be granted for up to five years from the date of termination of the Agreement and is subject to Departmental approval. The extension request and fees shall be submitted to the Department's South Coast Region office at the above address, Attn: Streambed. If the Operator fails to request the extension prior to the Agreement's termination, then the Operator shall submit a new notification with fees and required information to the Department. Any construction/impacts conducted under an expired Agreement are a violation of Fish and Game Code Section 1600 *et seq*. For complete information see Fish and Game Code Section 1600 *et seq*.

All provisions of this Agreement remain in force throughout the term of the Agreement. Any provisions of the Agreement may be amended or the Agreement may be terminated at any time provided such amendment and/or termination is agreed to in writing by both parties. Mutually approved amendments become part of the original Agreement and are subject to all previously negotiated provisions.

It is understood that the Department has entered into this Streambed Alteration Agreement for purposes of establishing protective provisions for fish and wildlife. The decision to proceed with the project is the sole responsibility of the Applicant, and is not required by this Agreement. It is further agreed that all liability and/or incurred cost related to or arising from the Operator's project and the implementation of the fish and wildlife protective conditions of this Agreement, remain the sole responsibility of the Applicant. The Applicant agrees to hold harmless the State of California and the Department against any related claim made by any party or parties for personal injury or any other damages.

The Department reserves the right to suspend or cancel this Agreement under one or more of, but not limited to, the following circumstances:

a. the Department determines that the information provided by the Applicant in support of the Notification/Agreement is incomplete or inaccurate;
b. the Department obtains new information that was not known to it in preparing the terms and conditions of the Agreement;
c. the project or project activities as described in the Notification/Agreement change; and
d. the conditions affecting fish and wildlife resources change or the Department determines that project activities will result in a substantial adverse effect on the environment.

Before any suspension or cancellation of the Agreement, the Department will notify the Applicant in writing of the circumstances which the Department believes warrant suspension or cancellation. The Operator will have seven (7) working days from the date of receipt of this notification to respond in writing to the circumstances described in the Department's notification. Upon receipt of the Department's notification, the Operator shall cease all project activities which the Department specified in its notification. The Applicant shall not continue the specified activities until that time when the Department notifies the Operator in writing that methods and/or measures have been identified, agreed upon, and implemented to adequately address the reasons for which the Department suspended or cancelled this Agreement.

The Department reserves the right to enter the project site at any time to ensure compliance with terms/conditions of this Agreement.

Project Location

The agreed work includes activities associated with Project description below. The Orange County Loftus Channel project area is located at Brea Plaza, 413 S. Associated Road and bound to the west by the existing Brea Plaza and parking lot, to the south by Imperial Highway, to the east by Associated Road, and to the north by existing commercial/office uses and the northern extension of the Loftus Channel, a tributary to the San Gabriel River in the City of Brea, Orange County.

Project Description

The Applicant proposes to alter the streambed and banks through the implementation of the proposed project. The total project area within the ephemeral Loftus Channel creek property is approximately 2 acres. The project proposes to replace 740 linear feet of the existing open portions of the Loftus diversion channel with a 55 foot wide, enclosed four celled reinforced concrete box culvert. The area above the improved culvert will be used to provide additional parking areas for the Brea Plaza Shopping Center, landscaping, sidewalks, and related improvements. Implementation of the project (expansion of Brea Plaza parking and landscaping) will result in direct impacts to one (1) impact area along a 740-foot length and average width of 38.4 feet, from top of slope to top of slope of the existing Loftus Channel. A jurisdictional delineation performed for the project finds 1.28 acres of permanent jurisdictional impacts for the Department. Significant water quality benefits are planned to offset the minor temporary construction impacts of the project primarily as a result of the first flush basins integrated into the project design. The first flush basins will provide water quality clean up to not only the run-off from the small ±2-acre County property itself, but especially the upstream 13-acre accumulation of urban watershed, which flows unfiltered today from asphalt parking spaces, rooftops and other pollution gathering areas into the existing channel in several different unfiltered inlet points. The green grass bio swale provides a stable water quality solution and a more permanent vegetation and biological solution. All existing inlets, which flow into Loftus Channel, will be designed and constructed to flow through the green grass-lined bio swale for water quality filtration prior to low flow entry into Loftus Channel. The Katchall Baffle Filters will be constructed upstream of the new boxed channel to mitigate for water quality impacts.

CONDITIONS

The following provisions constitute the limit of activities agreed to and resolved by this Agreement. The signing of this Agreement does not imply that the Applicant is precluded from doing other activities at the site. However, activities subject to Fish and Game Code Section 1600 *et seq.* and not specifically agreed to and resolved by this Agreement shall require separate notification.

General

1. If the Applicant or any of the individuals mentioned below violate any of the terms or conditions of this Agreement, all work shall terminate immediately and shall not proceed until the Department and Operator determine what actions are necessary to address the violations.

2. The agreed work includes activities associated with project location and project description

described above. Specific work areas and mitigation measures are described on/in the plans and documents submitted by the Operator (1602 Notification Application received on January 22, 2008, Map/photos and Impact area chart, and shall be implemented as proposed unless directed differently by this agreement

3. The Applicant shall provide a copy of this Agreement to all contractors, subcontractors, and the Operator's project supervisors. Copies of the Agreement shall be readily available at work sites at all times during periods of active work and must be presented to any Department personnel, or personnel from another agency upon demand.

4. The Applicant shall notify the Department, in writing, at least five (5) days prior to initiation of project activities and at least five (5) days prior to completion of project activities. Notification shall be sent to the Department at the South Coast Region office, Attn: Streambed, SAA#1600-2008-0029-R5.

Impacts

5. The Applicant shall not impact more than 1.28 acre of earthen flood control channel, consisting of ruderal weed and reed vegetation of which all are permanent impacts.

Mitigation

6. The Applicant shall mitigate 1.28 acre of permanent impacts to the stream channel at compensation to impact ratio of 1.5:1 ratio, by providing adequate funding to the San Gabriel Mountains Conservancy for the creation, restoration and enhancement of a minimum of 1.92 acre riparian habitat at a Department approved location. The money shall be used only for the creation, restoration and enhancement of riparian habitat. The location and activities of the riparian habitat creation, restoration and enhancement shall be approved by the Department prior to commencing project activities. Proof of payment of fees shall be submitted to the Department prior to commencing project activities. Project mitigation shall consist of creation of a minimum of 1.0 acre riparian habitat, and the remainder of the mitigation obligation of 0.92 acre shall consist of any combination of riparian habitat creation, restoration, and enhancement, as approved by the Department.

7. All temporary disturbed portions of the stream channel or banks shall be restored.

8. No later than 180 days of signing this Agreement, the Applicant shall submit to the Department for review and written approval, a mitigation plan designed to meet the identified objectives described in Condition No. 6 of this Agreement. The plan shall identify and describe the creation, restoration and enhancement of 1.92 acre of riparian habitat (1.5:1 ratio for permanent impacts). The mitigation plan should be prepared by persons with expertise in southern California ecosystems and native plant restoration. The plan should include at minimum: (a) the location of the mitigation site; (b) the plant species to be used; (c) a schematic depicting the mitigation area; (d) grading activities and plans (if any); (e) time of year that the planting will occur; (f) a description of the irrigation methodology; (g) measures to control exotic vegetation on site; (h) success criteria; (i) a detailed monitoring program; and (j) contingency measures should the success criteria not be met. Revegetation shall use only native species. Project activities may commence upon, but not before, written Department approval of the Operator's Draft Mitigation Plan. The location of the mitigation site shall avoid

the conversion of other native habitats (e.g coastal sage scrub) to riparian/wetland habitat, and shall identify sites with appropriate soil water availability.

9. An annual report shall be submitted to the Department by Jan. 1 of each year for 5 years after planting. This report shall include the success of the creation, restoration and/or enhancement effort, and the method used to assess these parameters shall also be included. Photos from designated photo stations shall be included.

Fish and Wildlife Protection

10. The Applicant shall not remove vegetation within the stream from March 1st to July 15th to avoid impacts to breeding/nesting birds. However, work may occur during this time if a qualified biologist conducts a minimum of three days of surveys for nesting birds within seven days prior to the vegetation removal, and at least one survey must be within three days prior to the vegetation removal, to ensure no nesting birds shall be impacted by the project. These surveys shall include the areas within 200 feet of the edge of the proposed impact areas, if possible (as adjacent property access allows). Documentation of findings, including a negative finding must be submitted to the Department for review and concurrence. If active nests are observed, the operator shall provide a buffer zone of at least 100 feet (300 feet for raptors) until the young have fledged, are no longer being fed by the parents, have left the nest, and will no longer be impacted by the project.

Be advised, migratory nongame native bird species are protected by international treaty under the Federal Migratory Bird Treaty Act (MBTA) of 1918(50 C.F.R. Section 10.13). Sections 3503, 3503.5 and 3513 of the California Fish and Game Code prohibit take of all birds and their active nests including raptors and other migratory nongame birds (as listed under the Federal MBTA).

11. No direct or indirect impacts shall occur to any threatened or endangered species, as a result of implementing the project or the project's activities. If any threatened or endangered species could be impacted by the work proposed, U.S. Fish and Wildlife Service (USFWS) protocol surveys shall be conducted prior to implementing the project, or the project's mitigation activities. If necessary, the Operator shall obtain the required state and federal threatened and endangered species permits. If there is no USFWS survey protocol for a particular listed species, the Department shall be consulted to determine appropriate survey procedures. The Department shall be provided copies of survey reports prior to project implementation, and prior to the implementation of mitigation activities. This agreement does not authorize the take of any federal or state threatened or endangered species.

12. The work area, as represented in plans, shall be identified to all workers. Native vegetation shall not be removed or intentionally damaged beyond the designated limits.

13. The removal of soil and vegetation, other than non-native vegetation from the Jurisdictional areas is prohibited, except where provided for within this agreement, without prior written approval from the Department.

14. The Applicant shall remove non-native vegetation from the work area and shall dispose of it in a legal manner; in all cases it shall be placed in a manner which prevents its

reestablishment in the Waters of the State, and in such a manner so that it does not negatively effect other sensitive native habitat communities. If the Operator determines that the treated non-native vegetation should be left in place, the Operator shall provide the Department a written (letter, fax, E-mail) description of where and why the treated vegetation should not be removed. If the Operator does not receive a written (letter, fax, E-mail) positive response from the Department, the treated exotic vegetation shall be removed.

15. No herbicides shall be used on native vegetation.

16. All herbicide use conditions for mixing, application and clean-up shall conform with all applicable federal, State, and local regulations, nothing in this Agreement represents a pesticide use recommendation that allows for an actions that conflict with pesticide use regulations.

17. Any application of herbicide shall be done by a licensed applicator in accordance with the applicable, federal, state, local laws, and County Park procedures and/or guidelines. No herbicides shall be used where Threatened or Endangered species occur. No herbicides shall be used when wind velocities are above 5 miles per hour.

18. No vehicles shall be operated within the stream except as described as follows: Vehicles may be used to carry equipment and transport cut vegetation; all vehicles shall use existing roads for access to the sites; small soft rubber-tired ATV's may be used where existing road access is not available, provided that such ATV's can access the central channel without entering wetland areas or damaging native vegetation. *Native vegetation shall NOT be impacted by any vehicle use.*

19. Herbicide mixing sites shall only be located in areas devoid of vegetation, and where there is no potential of a spill reaching a vegetated area or a stream, for example avoid mixing at a storm water-inlet.

20. Any herbicide used where there is the possibility that the herbicide could come into direct contact with water shall be approved for use in an aquatic environment (e.g. Rodeo). Great care shall be taken to avoid contact with any native vegetation, and it shall only be applied on calm days to prevent airborne transfer of the herbicide.

Equipment and Access

21. No equipment shall be operated in ponded or flowing areas. When work in a flowing stream is unavoidable, the entire flow shall be diverted around the work area by a barrier, temporary culvert, new channel, or other means approved by the Department. Construction of the barrier and/or the new channel shall normally begin in the downstream area and continue in an upstream direction, and the flow shall be diverted only when construction of the diversion is completed. Channel bank or barrier construction shall be adequate to prevent seepage into or from the work area. Channel banks or barriers shall not be made of earth or other substances subject to erosion unless first enclosed by sheet piling, rock rip-rap, or other protective material. The enclosure and the supportive material shall be removed when the work is completed and removal shall normally proceed from downstream in an upstream direction.

22. Staging/storage areas for equipment and materials shall be located outside of the stream.

23. No equipment maintenance shall be done within or near any stream channel where petroleum products or other pollutants from the equipment may enter these areas under any flow.

24. Vehicles shall not be driven or equipment operated in water covered portions of a stream or lake, or where wetland vegetation, riparian vegetation, or aquatic organisms may be destroyed.

Pollution, Sedimentation and Litter

25. Precautions to minimize turbidity/siltation shall be taken into account during project planning and shall be installed prior to construction. Silt curtains, and floating debris booms will be used during pile installation to reduce turbidity. Precautions may also include placement of silt fencing, straw bales, sand bags, and/or the construction of silt catchment basins, so that silt or other deleterious materials are not allowed to pass to Waters of the State. The method used to prevent siltation shall be monitored and cleaned/repaired weekly. The placement of any structure or materials in the Waters for this purpose, not included in the original project description, or Department approved water pollution/water diversion plan shall be coordinated with the Department. Coordination shall include the negotiation of additional Agreement provisions.

26. No debris, soil, silt, sand, bark, slash, sawdust, rubbish, construction waste, cement or concrete or washings thereof, asphalt, paint, oil or other petroleum products or any other substances which could be hazardous to aquatic life, or other organic or earthen material from any logging, construction, or other associated project related activity shall be allowed to contaminate the soil and/or enter into or placed where it may be washed by rainfall or runoff into, waters of the State. Any of these materials, placed within or where they may enter a stream or lake, by the Operator or any party working under contract, or with the permission of the Operator, shall be removed immediately. When operations are completed, any excess materials or debris shall be removed from the work area. No rubbish shall be deposited within 150 feet of the high water mark of any waters.

27. The Operator shall comply with all litter and pollution laws. All contractors, subcontractors and employees shall also obey these laws and it shall be the responsibility of the operator to insure compliance.

28. The Operator shall mark/sign/stencil all storm drains warning that dumping is illegal and all storm drains drain to creeks/rivers or ocean.

29. Any equipment or vehicles driven and/or operated within or adjacent to the stream/lake shall be checked and maintained daily, to prevent leaks of materials that if introduced to water could be deleterious to aquatic life.

30. Stationary equipment such as motors, pumps, generators, and welders, located within or adjacent to the stream/lake shall be positioned over drip pans. Stationary heavy equipment shall have suitable containment to handle a catastrophic spill/leak. Clean up equipment such as extra boom, absorbent pads, skimmers, shall be on site prior to the start of dredging.

31. No equipment maintenance shall be done within or near any stream channel or lake margin where petroleum products or other pollutants from the equipment may enter these areas under any flow.

32. Raw cement/concrete or washings thereof, asphalt, paint, construction waste, or other coating material, oil or other petroleum products, or any other substances which could be hazardous to aquatic life, resulting from project related activities, shall be prevented from contaminating the soil and/or entering the waters of the state. Any of these materials, placed within or where they may enter a stream or lake, by the Operator or any party working under contract, or with the permission of the Operator, shall be removed immediately.

33. Upon Department determination that turbidity/siltation levels resulting from project related activities constitute a threat to aquatic life, activities associated with the turbidity/siltation, shall be halted until effective Department approved control devices are installed, or abatement procedures are initiated.

34. Water containing mud, silt, or other pollutants from equipment washing or other activities, shall not be allowed to enter a lake or flowing stream or placed in locations that may be subjected to high storm flows.

35. Cement and concrete shall not be poured within 150 feet of a stream during the rainy season. The Operator shall monitor the 7-day forecast; cement or concrete materials may be poured only if a 7-day clear window is predicted. Cement shall not be poured in or near a flowing stream, to reduce the potential for significant adverse impacts to the stream, water, or biota.

Maintenance:

36. Except as otherwise permitted in this Agreement, the removal of soil, native vegetation, and vegetative debris from the jurisdictional area is prohibited. The Operator shall remove all human generated debris, such as lawn and farm cuttings, garbage and trash. The Operator shall remove washed out culverts, and other construction materials, that the Operator places within, or where they may enter the stream.

37. The clean-up of all spills shall begin immediately upon observation of the spill. The Department shall be notified immediately by the Operator of any spills and shall be consulted regarding clean-up procedures.

38. Any and all garbage/debris found within the stream channel shall be removed and legally disposed of by the Operator.

Thank you. After reviewing the submitted information and talking with you today, Board staff is approving the Bio Clean weirs as a substitute for the Katchall weirs proposed for Loftus Channel at Brea Plaza. Please be reminded that a monitoring plan is required to validate the weirs' expected performance. --Adam

Adam,

See attached response from BioClean. After your review, please contact me with any questions. My goal is that RWQMCB will accept this system in lieu of the Katchall system that is currently on plan. Upon your approval, we will modify the County plan, plus the City WQMP to reflect the change.

Thank you,

Subject: RE: Brea Plaza - Filtration Weirs

Hello James,

Below are responses to the questions.

1) The assumption that the low-flow volumes will tend to the center of the channel are questionable. Since the channel is constructed, it would make sense to field-verify this assumption now and document that it is the case. You should understand that even if the central tendency exists today, it may not continue over the long term. In the event that

flow tends to one side due to settling of the channel or deposition, the operator will need to adaptively manage by moving the weirs, change maintenance procedures, or taking other corrective action.

Based upon our field visit the bottom of the channel is relatively flat. The grading does appear to convey very low flows o the right side. The variation in elevation from right to left side is approximately 2 inches. See pictures. When weirs are added it will slow the water down and raise the HGL on the influent side of the weir. At the point when the HGL (say 2 or 3 inches) overcomes the slight slope to the right the water will start to distribute evenly across the 30' face of the weir. In summary, the slight slope of the channel to the right is insignificant with HGLs greater than 2 inches. What will be created is a ponding affect.

From the perspective of deposition of sediments and debris the slight slope to the right will cause accumulation of these pollutants to be more prominent on that side. Once again, since the slope is so slight we do not anticipate it to be a significant concern to the function of the weirs. We do recommend the observation of the weirs operation over the first few months to asses if corrective action need to be taken even though it is not anticipated. If large amounts of accumulation take place on the right side we simply recommend a more frequent removal of the blocked sediments and debris. Our weirs are designed to handle large weight and hydraulic loads so the accumulation of sediments behind the weirs is not a structural issue.

2) I'd like some assurance that you're carefully considering the logistics of meeting OC Flood's request to remove the weirs ahead of forecast storms. It's important that the procedure be as practical as possible so that it isn't an unrealistic burden and the request can be readily met. Please describe the procedure for accessing the channel, removing the weirs, transporting them out of the channel, storing them, and re-installing them. If your consideration of the procedure results in any changes to the mounting system or the weirs' configuration, please describe the changes.

Our design team assessed the design of the original Katchall Filter Weirs and found a great lack of detail with the drawings that appeared to be done in Microsoft Word. Some of the materials were called out as grated fiberglass and metal vertical supports had no signs of material running perpendicular to the weirs which would give the weirs strength and rigidity. Our design team concluded that the original design mayencounter issues with the hydrostatic pressure or substantial accumulation of sediment. The original design has a weak point at the base, a focal point where the weir could break under heavy loading or flow conditions. We also noticed it called for a 30' channel for each weir that did not appear to be removable. If it were to be removed it would be difficult to do so given the length.

To overcome the inconsistencies and lack of detail of the original design we made necessary changes and based our design upon a current setup we have been using. First, we should mention that the Bio Clean weirs are fabricated from 100% 304 stainless steel L metal and perforated stainless steel screen. The weirs have been fabricated in 5' sectionsfor easy removal and replacement. The weirs will be attached with stainless steel red heads for strength and easy removal and replacement. This method is much easier than the original Katchall design. One of the most important thing we did with the design is incorporate 45 degree bracing on both sides of the weirs. Without this bracing the weirs would not be able to deal with worst case scenario of the weirs being submerged during higher flows. While it is still the intention to remove the screens during rain events, as a stormwater company with over 10 years experience in the industry, we design our devices to deal with worst case scenario. Weirs without bracing during high flows would have all the weight put on the bolts that fasten the main weir to the bottom of the channel. With no bracing those bolts could easily shear off.

In summary, the weir system we designed is easier to install, to remove, is more durable and are designed to deal with high flow rate and loading conditions which should be assumed with any device installed in a large drainage channel. See attached pictures of how the weir is constructed.

3) What performance warranties is the manufacturer providing?

As a experienced stormwater filtration company we will not make non-realistic claims similar to those listed in the Katchall approval regarding pollutant removal performance and flow rate per square foot surface area of media. Based upon our experience it's apparent that the numbers don't make sense. Just a few thing to point out:

- A flow rate of .4 cfs (179 gpm) per square foot surface area is not realistic (realistic flow rate for media is 2-50 gpm given the minimal head available).

- It's not logical to add all the total flow rates of each weir to get a total treatment flow rate of 27 cfs since the weirs are in series and are different heights.
- Claims made such as "50% removal of all nitrates, phosphates and phosphorus" has little validity considering those pollutants are very different and require different types of filtration to accomplish and therefore removal rates would vary.
- The anti-microbial fabric used by Katchall is manufactured by X-TEX out of Washington. They no longer even manufacture the anti-microbial fabric. The 99% removal efficiency with 1 second contact time is no supported by the manufacture.

What we will provide is third party independent testing, see attached performance report of the filtration media we are using in the last weir called BioMediaGREEN. The two prior weirs will use perlite and activated charcoal as pre-treatment for the last weir. These BioMediaGREEN filter weirs have been approved by the San Diego Regional Board and are now being used by the City of Los Angeles to pre-treat infiltration facilities. Without know the precise concentrations and form of each pollutant in the channel performance guarantees cannot be made. We doubt that Katchall can make such claims either.

The BioMediaGREEN filter weirs have been tested and proven in the field. The media was tested in the same horizontal configurations that these weirs are being installed. Given the tested flow rate at 3 gpm per square foot with minimal head and the third weir having 150 square foot surface area a treatment flow rate of 1 CFS is realistic.

While our intentions are not to discredit the Katchall technology, we feel it is our responsibility as a company to point out the truths about design and performance and be realistic about what can be expected of filtration weirs being installed in large drainage culverts. That being said we know the system we designed for this project will provide the best structural solution, is easy to remove and will provide excellent and realistic performance claims. The design proposed will offer several advantages over the original design to ensure this project is a success.

Let me know if you need anything else.

Sincerely,

Zach J Kent, CISEC

Subject: RE: Brea Plaza - Filtration Weirs

Thank you. I have some comments I'd like for you all to respond to.

1) The assumption that the low-flow volumes will tend to the center of the channel are questionable. Since the channel is constructed, it would make sense to field-verify this assumption now and document that it is the case. You should understand that even if the central tendency exists today, it may not continue over the long term. In the event that flow tends to one side due to settling of the channel or deposition, the operator will need to adaptively manage by moving the wiers, change maintenance procedures, or taking other corrective action.

2) I'd like some assurance that you're carefully considering the logistics of meeting OC Flood's request to remove the weirs ahead of forecast storms. It's important that the procedure be as practical as possible so that it isn't an unrealistic burden and the request can be readily met. Please describe the procedure for accessing the channel, removing the weirs, transporting them out of the channel, storing them, and re-installing them. If your consideration of the procedure results in any changes to the mounting system or the weirs' configuration, please describe the changes.

3) What performance warranties is the manufacturer providing?

>>> James Palda <jpalda@SteadfastCcompanies.com> 12/9/2010 4:27 PM >>>
Adam, per our discussion, attached are the plan check comments we received from Flood Control.

Subject: Re: Brea Plaza - Filtration Weirs

Thanks James: I'll look this over carefully. In the meantime, please also pass this on to County Flood since they'll have approval authority focused on the hydraulic capacity of the channel. They might want the weirs removed quickly before forecast storms, which may affect the design.

>>> James Palda <jpalda@SteadfastCompanies.com> 12/9/2010 4:12 PM >>>
Adam,

I've been working with Marc on the Brea Plaza redevelopment and the filtration devices. It's my understanding our filtration device needs to be the Katchall System or Equal pursuant to the RWQMCB permit.
We are attempting to modify the existing County plans by replacing words "Katchall System" with regard to our filtration system. Attached is a supporting letter from Bio Clean Environmental and their Bio Clean Environmental Weir Wall Filtration Device which will be at least equal to the Katchall System.

In order for us to complete the project and install the system, we need a letter of approval from RWQMCB. Bio Clean is standing by, ready to install.

Please contact me with any questions.

Thank you,

James Palda

CLEAN WATER ACT SECTION 401 WATER QUALITY STANDARDS CERTIFICATION FOR THE LOFTUS CHANNEL MODIFICATION PROJECT, CITY OF BREA, ORANGE COUNTY (ACOE REFERENCE NO. 200800232 – JPL)

Dear Mr. Nadhir:

On January 22, 2008, we received an application for Clean Water Act Section 401 Water Quality Standards Certification (Certification) for modifications to a reach of the Loftus Channel in the City of Brea. This letter responds to your request for certification that the proposed project, described in your application and summarized below, will comply with State water quality standards outlined in the Water Quality Control Plan for the Santa Ana River Basin (1995) and subsequent Basin Plan amendments:

Project Description:	Modification of a 740-foot long reach of the Loftus Channel. In its current configuration, this channel reach is earth-bottomed with rip-rap banks. The proposed project will place this reach underground within a four-cell, reinforced concrete box. The project will enable the expansion of the Brea Plaza, which will involve the demolition and construction of several retail buildings, the expansion of the parking lot within Orange County Flood Control right-of-way along Loftus Channel, and the construction of a new sidewalk and landscaping along Associated Road. The project is located north of the intersection of Associated Road and Imperial Highway within Section 13 of Township 3 South, Range 10 West, of the U.S. Geological Survey *La Habra, California*, 7.5-minute topographic quadrangle map (33.91158 degrees N/ -117.88053 degrees W).
Receiving water:	Loftus Channel.
Fill area:	0.28 acre of permanent impact to an intermittent stream (800 linear feet).

Dredge/Fill volume: N/A

Federal permit: U.S. Army Corps of Engineers Nationwide Permit No. 14

You have proposed to mitigate water quality impacts as described in your Certification application and subsequent submittals. The proposed mitigation is summarized below:

Onsite Water Quality Standards Mitigation Proposed:

- Pollutants in storm water runoff from the existing and new portions of Brea Plaza will be treated in a bio-swale in the landscaped area along Associated Road. The bio-swale will be maintained by California Brea Partners, LP.
- The lost pollutant attenuation function of Loftus Channel will be replaced by Katchall Baffle Filters® constructed upstream of the new boxed channel. The filters will be maintained by California Brea Partners, LP.
- Additional best management practices ("BMPs") for removing pollutants in storm water runoff from the Brea Plaza will be specified in the project Water Quality Management Plan ("WQMP") and Storm Water Pollution Prevention Plan ("SWPPP").

Offsite Water Quality Standards Mitigation Proposed:

- An in-lieu fee will be paid to the San Gabriel Mountains Regional Conservancy towards the restoration of 2.0 acres of riparian habitat in Lemon Creek, downstream of Bicentennial Park in the City of Walnut[1]. The work will include eradication of invasive plant species and re-vegetation with appropriate native species.

Should the proposed project impact state- or federally-listed endangered species or their habitat, implementation of measures identified in consultation with U.S. Fish and Wildlife Service and the California Department of Fish and Game will ensure those impacts are mitigated to an acceptable level. Appropriate BMPs will be implemented to reduce construction-related impacts to Waters of the State. Since the project is more than one acre, coverage under the State Water Resources Control Board's General Permit for Storm Water Discharges Associated with Construction Activity, Water Quality Order 99-08 DWQ, (General Stormwater Permit) is required, which requires as a condition development and implementation of a SWPPP, to control the discharge of pollutants from the project site.

You have applied for a Nationwide Permit from the U.S. Army Corps of Engineers in compliance with Section 404 of the Clean Water Act. You have applied for a Streambed Alteration Agreement with the Department of Fish and Game. The County of Orange approved a Land Use Entitlement Agreement allowing the lease of County land for the

[1] Oral communication with Ann Croissant of the San Gabriel Mountains Regional Conservancy on July 7, 2008.

expansion of Brea Plaza and facilitating the alteration of Loftus Channel. Pursuant to the California Environmental Quality Act ("CEQA"), the County found that the Land Use Entitlement Agreement was exempt from CEQA pursuant to California Code of Regulations, Title 14, Chapter 3 ("CEQA Guidelines"), sections 15301 and 15332. Subsequently, the City of Brea prepared and adopted a Mitigated Negative Declaration for the demolition of structures at the Brea Plaza, the construction of two new buildings, and the expansion of the parking lot over the Loftus Channel on June 10, 2008.

Pursuant to CEQA Guidelines section 15096, as a responsible agency, the Regional Board is required to consider the Mitigated Negative Declaration prepared by the City of Brea in independently determining whether and how to approve the proposed project. Accordingly, the Regional Board has considered the City's Mitigated Negative Declaration in the issuance of this Certification and finds that changes or alterations have been required, or incorporated into the project, that avoid or mitigate impacts to water quality to a less than significant level.

This 401 Certification is contingent upon the execution of the following conditions:

1) An in-lieu fee payment must be made to the San Gabriel Mountains Regional Conservancy towards the eradication of invasive woody plant species on 2.0 acres of Lemon Creek, City of Walnut, and re-vegetation of the area with appropriate native plants with 5-years of follow-on maintenance. The in-lieu fee payment must include funding for the completion of functional assessment(s) of the mitigation site for the purposes of quantitatively measuring the marginal increase in riparian stream functions. The functional assessment(s) must be completed using published and generally accepted methods (e.g., Collins, J., Stein, E., et al., 2006 California Rapid Assessment Method (CRAM) for Wetlands and Riparian Areas, www.cramwetlands.org). Evidence of the in-lieu fee payment must be provided to the Executive Officer by November 7, 2008. The results of the functional assessments must be provided to the Executive Officer not later than 90-days following their completion.
2) This certification is conditioned upon the construction and operation of all proposed structural treatment controls described above. The structural treatment controls for removing pollutants in storm water runoff from Brea Plaza must be completed and operational prior to the occupancy of any new building. The proposed Baffle Filters® must be in place and operational upon completion of the concrete box channel.
3) California Brea Partners, LP must implement a water quality monitoring program for the purpose of evaluating the performance of the Baffle Filters® as analyzed in the Anti-degradation Analysis performed for the proposed project. The water quality monitoring program must complement the monitoring being performed by permittees under Order No. R8-2002-0010, NPDES Permit No. CAS618030, commonly known as the Orange County Municipal Storm Water Permit. A draft

monitoring plan must be provided to the Executive Officer for approval by October 7, 2008. The monitoring plan must be fully implemented upon approval.

4) In the event that the proposed Baffle Filters® do not achieve reductions for pollutants of concern identified in the Anti-degradation Analysis that are equivalent to the natural pollutant attenuation function of the filled channel, California Brea Partners, LP must implement additional best management practices to replace the natural pollutant attenuation function of the filled Loftus Channel. California Brea Partners, LP may at any time update the natural pollutant attenuation rates in the Anti-degradation Analysis using the best available scientific information.
5) The applicant must comply with the requirements of the Clean Water Act section 404 permit.

Under California Water Code, Section 1058, and Pursuant to 23 CCR §3860, the following shall be included as conditions of all water quality certification actions:

(a) Every certification action is subject to modification or revocation upon administrative or judicial review, including review and amendment pursuant to Section §13330 of the Water Code and Article 6 (commencing with Section 3867) of this Chapter.

(b) Certification is not intended and shall not be construed to apply to any activity involving a hydroelectric facility and requiring a FERC license or an amendment to a FERC license unless the pertinent certification application was filed pursuant to Subsection §3855(b) of this Chapter and that application specifically identified that a FERC license or amendment to a FERC license for a hydroelectric facility was being sought.

(c) Certification is conditioned upon total payment of any fee required under this Chapter and owed by the applicant.

If the above stated conditions are changed, any of the criteria or conditions as previously described are not met, or new information becomes available that indicates a water quality problem, the Regional Board may require the applicant to submit a report of waste discharge and obtain Waste Discharge Requirements.

In the event of any violation or threatened violation of the conditions of this certification, the holder of any permit or license subject to this certification shall be subject to any remedies, penalties, process or sanctions as provided for under state law. For purposes of section 401(d) of the Clean Water Act, the applicability of any state law authorizing remedies, penalties, process or sanctions for the violation or threatened violation constitutes a limitation necessary to assure compliance with the water quality standards and other pertinent requirements incorporated into this certification. Violations of the conditions of this certification may subject the applicant to civil liability pursuant to Water Code section 13350 and/or 13385.

BMP MAINTENANCE SELF-CERTIFICATION FORM FOR THE CITY OF BREA

BMP Maintenance Self-Certification Form for the City of Brea

In addition to routine annual inspections conducted by the City for proper maintenance of post-construction stormwater control measures or Best Management Practices (BMPs) on the property, the City of Brea requires that the party responsible for maintenance of these BMPs receive proper orientation and training on their operations and maintenance. This form is to be completed by the owner representative and shall be made available to the City Authorized Inspector upon request. Should the maintenance provider or facility maintenance representative change at any time, the owner representative shall complete this form with the new responsible party for BMP maintenance.

Property Information	BMP O&M
Project Name: Brea Plaza Mixed-Use Project	**Responsible Party:** (Owner, management company or HOA/POA)

Project WQMP Summary Exhibit

This WQMP Summary Exhibit ("Summary Exhibit") is to ensure there is a consistent and clarified exhibit included as part of the WQMP submittal process. The purpose of this Summary Exhibit is for it to be used by City inspectors to verify that post-construction structural BMPs are implemented correctly at the project site and as described in the approved WQMP. Though similar, the required elements of this Summary Exhibit are separate from the WQMP Plot Plan that is otherwise found in the WQMP report, as it should only include information relevant to the understanding of stormwater BMP operations and maintenance (i.e. no construction notes) and minimize use of topo lines, elevation callouts, etc. The Summary Exhibit shall include the following elements:

- Drainage Management Areas (DMAs) and flow information (i.e. surface flow arrows and pipe flow arrows),
- BMPs (LID and Structural Source Control – i.e. trash enclosures, catch basin stenciling),
- FCS – Full Capture Systems for trash TMDLs,
- Other structural water quality devices (i.e. roof downspout filters),
- All connections between on-site stormwater structures and off-site storm drains,
- And list of structural BMP ID (CASQA-appropriate).

Where applicable, the applicant shall input concise BMP sizing information in tabular form in the Summary Exhibit. This BMP sizing information should include:

- DMA ID,
- BMP ID (i.e. MWS #1, CDS #1, INF #1) and TGD BMP ID (i.e. BIO-1, BIO-7, INF-1, HSC-2),
- BMP description (i.e. dimensions, model number),
- And BMP location coordinates.

Color can be used to highlight the information above but should not be used for other plan details. Details unrelated to stormwater should be turned off/screened back/de-emphasized where possible. If using a hatch for pavement or landscaping, ensure it is also screened back and not distracting from BMPs.

Subject: **Revised Vehicle Miles Traveled (VMT) Screening Assessment for The Brea Plaza Expansion Project**
Brea, California

Dear Ms. Vermilion,

Linscott, Law & Greenspan, Engineers (LLG) is pleased to submit this Revised Vehicle Miles Traveled (VMT) Screening Assessment for the Brea Plaza Expansion Project, hereinafter referred to as the Project. Brea Plaza is an existing retail center addressed at 409-477 S. Associated Road and 1555, 1609, 1623, 1643 E. Imperial Highway that is generally located north of Imperial Highway, west of Associated Road, and east of SR-57 Freeway in the City of Brea, California. ***Figure 1*** presents a Vicinity Map, which illustrates the general location of the proposed Project and the surrounding street system. ***Figure 2*** presents an aerial depiction of the existing site.

The existing Brea Plaza includes 165,329 square-feet (SF) of floor area consisting of mixture of retail/commercial use, service/retail shops, a movie theatre, restaurant/ food uses and fast-food restaurants with drive-through. The proposed Project includes a mixed-use development that consists of 21,355 SF of office space and 189 apartment units. Fifteen (15) of the proposed apartments are considered co-living units, which include five (5) 3-bedroom units and ten (10) four-bedroom units, therefore, to provide a conservative assessment, the co-living unit bedrooms have been counted as individual units for a total apartment count of 229 units. The implementation of the Project would require the demolition of the existing 18,450 SF movie theatre (Brea Plaza 5 Cinemas). ***Figure 3*** presents the proposed project site plan.

SB743 COMPLIANCE VMT SCREENING ASSESSMENT

The purpose of this Vehicle Miles Traveled (VMT) analysis is to evaluate the Project based on Senate Bill 743 (SB 743) requirements consistent with the *Technical Advisory on Evaluating Transportation Impacts In California Environmental Quality Act* (CEQA), December 2018, prepared by the State of California Governor's Office of Planning and Research (OPR). The OPR Technical Advisory provides project screening criteria and guidance for analysis of VMT assessments under SB 743. With the adopted guidelines, transportation impacts are to be evaluated based on a project's effect on vehicle miles traveled which took effect July 1, 2020, as required in CEQA section 15064.3.

The City of Brea adopted VMT guidelines in October 2020 which are consistent with the OPR Technical Advisory which states projects generating less than 110 daily vehicle trips may be presumed to have a less than significant impact. As outlined in ***Table 1,*** the proposed Project to replace the existing movie theater with apartments and office space is anticipated to result in a net reduction in site generated traffic of approximately 1,680 trips on a typical weekday. Since the construction of the proposed Project will result in a net reduction of daily vehicle trips to and from the site, it can be assumed that vehicle miles traveled would also be reduced and thus the project will have no significant negative impact on the transportation system and no further study is recommended or required.

CONCLUSION

Based on the conduct of a trip generation assessment, the proposed Project is anticipated to generate less than 110 daily vehicle trips. Therefore, in accordance with the City of Brea's Transportation Impact Analysis Guidelines, the proposed Project is exempt from the conduct of any further analysis, and it is assumed that its implementation will not result in any significant CEQA related transportation impacts.

* * * * * * * * * *

We appreciate the opportunity to be of service on this Project. Should you need further assistance, or have any questions regarding this analysis, please call us at (949) 825-6175.

Very truly yours,
Linscott, Law & Greenspan, Engineers

Richard E. Barretto, P.E.

Notes:

- TE/TSF = Trip End per Thousand Square Feet Gross Leasable Area
- TE/DU = Trip End per Dwelling Unit
- TE/Seat = Trip End per Seat

1 Source: *Trip Generation*, 10th Edition, Institute of Transportation Engineers (ITE), Washington, D.C. (2017).

2 Trip Generation rates based on the following equations:
- Weekday Daily: Ln(T) = 0.68Ln(X) + 5.57
- Weekday AM Peak Hour: T = 0.50(X) + 151.78
- Weekday PM Peak Hour: Ln(T) = 0.74Ln(X) + 2.89
- Saturday Daily: Ln(T) = 0.62Ln(X) + 6.24
- Saturday Peak Hour of Generator: Ln(T) = 0.79Ln(X) + 2.79

3 Pass-By Trips are trips made as intermediate stops on the way from an origin to a primary trip destination. Pass-by trips are attracted from traffic passing the site on adjacent streets, which contain direct access to the generator. For this analysis, the following pass-by reduction factors were used (Source: *Trip Generation Handbook,3rd Edition*, ITE 2017):
- 820: Shopping Center: PM Peak Hour – 34%, Daily/AM peak hour/Saturday Daily/Saturday Midday Peak Hour – Assume 10%

4 Consistent with the *Trip Generation Handbook,* published by ITE (2017), Project trip generation was adjusted to account for internal capture between the retail and residential components of the Project. As there are no Saturday internal capture worksheets available, Weekday Daily and Weekday PM peak hour calculations have been applied to Saturday Daily and Saturday Midday peak hour.

REVISED TRAFFIC CIRCULATION ANALYSIS

BREA PLAZA EXPANSION

Brea, California
July 29, 2021 (Original dated May 24, 2021)

1.0 INTRODUCTION

This Traffic Circulation Analysis report addresses the potential traffic and circulation needs associated with Brea Plaza Expansion Project (hereinafter referred to as Project) in the City of Brea. Brea Plaza is an existing retail center addressed at 409-477 S. Associated Road and 1555, 1609, 1623, 1643 E. Imperial Highway that is generally located north of Imperial Highway, west of Associated Road, and east of SR-57 Freeway. The proposed Project consists of the demolition of an existing 18,450 square-foot (SF) movie theater and the construction of a mixed-use development consisting of 21,355 SF office space and 189 apartments.

1.1 Scope of Work

This traffic circulation report documents the findings and recommendations of a traffic analysis conducted by Linscott, Law & Greenspan, Engineers (LLG) to determine the need for potential Project-related circulation improvements. The traffic analysis evaluates the existing operating conditions at nine (9) study intersections within the project vicinity, estimates the trip generation potential of the proposed Project, and forecasts future near-term (Year 2024) and General Plan Buildout (Year 2045) operating conditions without and with the proposed Project. Where necessary, intersection improvements are identified.

This traffic study report satisfies the traffic requirements of the City of Brea and is consistent with the current *Congestion Management Program (CMP) for Orange County.* The approved Scope of Work for this traffic study is included in ***Appendix A*** and was developed in conjunction with City of Brea Public Works Department staff.

The project site has been visited and an inventory of adjacent area roadways and intersections was performed. Existing weekday peak hour traffic count information has been collected at nine (9) study intersections for use in the preparation of intersection Level of Service (LOS) calculations. Information concerning cumulative projects (planned and/or approved) in the vicinity of the proposed Project has been researched at the Cities of Brea, Placentia and Fullerton. Based on our research, there are twelve (12) related projects in the City of Brea and two (2) related projects in the City of Fullerton. The fourteen (14) related projects were considered in the near-term cumulative traffic analysis for this project.

This traffic report analyzes existing and future weekday daily, AM peak hour and PM peak hour LOS traffic conditions for a near-term (Year 2024) and General Plan Buildout (Year 2045) traffic setting upon completion of the proposed Project. Near-term (Year 2024) cumulative daily and peak hour traffic forecasts were projected by incorporating both a one percent (1.0%) annual growth rate and the trip generation potential of fourteen (14) related projects. General Plan Buildout (Year 2045)

daily and peak hour traffic forecasts were projected based on traffic projections prepared by OCTA utilizing the OCTAM 5.0 Year 2045 Model.

1.2 Study Area

Nine (9) study intersections have been identified for evaluation in collaboration with City of Brea staff. The nine (9) intersections listed below provide regional and local access to the study area and define the extent of this traffic analysis.

Study Intersections – Jurisdiction

1. SR-57 SB Ramps at Imperial Highway (Caltrans)
2. SR-57 NB Ramps/Brea Plaza Driveway 1 at Imperial Highway (Caltrans)
3. S. Associated Road at Birch Street
4. S. Associated Road at Greenbriar Lane
5. S. Associated Road at Imperial Highway (Caltrans)
6. Castlegate Lane/Placentia Avenue at Imperial Highway (Caltrans)
7. S. Associated Road at Brea Plaza Driveway 2
8. S. Associated Road at Brea Plaza Driveway 3
9. Brea Plaza Driveway 4 at Imperial Highway (Caltrans)

Figure 1-1 presents a Vicinity Map, which illustrates the general location of the proposed Project and depicts the study locations and surrounding street system. The Level of Service (LOS) calculations at these study locations were used to evaluate the need for potential Project-related improvements associated with area growth, cumulative projects and the proposed Project. When necessary, this report recommends intersection and/or roadway improvements that may be required to accommodate future traffic volumes and restore/maintain an acceptable Level of Service. Included in this Traffic Circulation Analysis are:

- Existing traffic counts,
- Estimated project traffic generation/distribution/assignment,
- Estimated cumulative project traffic generation/distribution/assignment,
- Weekday AM and PM peak hour capacity analyses for existing conditions,
- Weekday AM and PM peak hour capacity analyses for future near-term (Year 2024) traffic conditions without and with the proposed Project,
- Weekday AM and PM peak hour capacity analyses for General Plan Buildout (Year 2045) traffic conditions without and with the proposed Project,
- Intersection Vehicle Queueing Evaluation,
- Intersection Safety Evaluation,
- Site Access Evaluation, and
- Congestion Management Program Compliance Assessment.

BREA PLAZA EXPANSION PROJECT, BREA

2.0 PROJECT DESCRIPTION

Brea Plaza is an existing retail center addressed at 409-477 S. Associated Road and 1555, 1609, 1623, 1643 E. Imperial Highway that is generally located north of Imperial Highway, west of Associated Road, and east of SR-57 Freeway in the City of Brea, California. ***Figure 2-1*** is an existing aerial photograph of the Project site, and also illustrates the general location of the proposed Project on the northwest corner of the subject property.

Table 2-1 summarizes the proposed Project development. The existing Brea Plaza includes 165,329 square-feet (SF) of floor area consisting of mixture of retail/commercial use, service/retail shops, a movie theatre, restaurant/ food uses and fast-food restaurants with drive-through. Parking for the retail center currently totals 725 on-site spaces with an additional 180 spaces available in an easement with Mercury Insurance during business hours and all spaces after 5:00 PM and on weekends. It is our understanding that the easement with Mercury Insurance will expire upon completion of the proposed Project, therefore, all of the project parking demands will be accommodated on-site.

The proposed Project includes a mixed-use development that consists of 21,355 SF of office space and 189 apartment units. Fifteen (15) of the proposed apartments are considered co-living units, which include five (5) 3-bedroom units and ten (10) four-bedroom units, therefore, to provide a conservative assessment, the co-living unit bedrooms have been counted as individual units for a total apartment count of 229 units.

The proposed Project also includes a 387-space and 10 tandem stall parking structure on the northwest quadrant of the subject property. The implementation of the proposed Project would require the demolition of the existing 18,450 SF movie theatre (Brea Plaza 5 Cinemas) and result in the overall loss of 116 surface parking spaces. ***Figure 2-2*** illustrates the conceptual site plan for the proposed Project prepared by Architects Orange, dated February 10, 2021.

2.1 Vehicular Site Access and Circulation

Vehicular access to Brea Plaza is currently provided via one (1) right-turn only and one (1) full access unsignalized driveways on Associated Road, and a right-turn only driveway on Imperial Highway, and the signalized intersection of Imperial Highway at SR-57 NB Ramps/Brea Plaza. No change in access to Brea Plaza is proposed as a part of the Project. Further, with the exception of the parking and circulation layout on the northwest corner of the site where the proposed Project will be constructed, no changes to the internal circulation and primary parking layout in the center and southern portion of the site will change. To maintain circulation around the entire property, the Project does propose to maintain/construct a "Fire Lane" along the northern and western edge of the Project thereby providing emergency vehicle as well as Project-related traffic the ability to circulate the entire site to access either Associated Road or Imperial Highway.

It should be noted that cross-access between Mercury Insurance and Brea Plaza is currently allowed via the Mercury Insurance easement. Patrons/employees of the Mercury Insurance Building are currently able to park in the existing parking spaces within Brea Plaza located in the north end of the

site. However, the easement will no longer be applicable as part of the proposed Project. Therefore, employees/patrons of Mercury Insurance will be expected to utilize Greenbriar Road to access their site rather than cutting through Brea Plaza. This shift in volumes has been accounted for under Project conditions.

2.2 Pedestrian and Bicycle Circulation

Brea Plaza is surrounded by other commercial and public facilities to the south and west of the site, including Brea Mall, and is also surrounded by existing residential uses to the north and east of the site. The walkability between these uses is facilitated by existing sidewalks, traffic signals at intersections that immediately border the property, and crosswalks.

Review of current conditions indicates that pedestrian connectivity between Brea Plaza and the adjacent uses are provided via the existing sidewalk system. Sidewalks are generally provided throughout the City along with crosswalks at most major intersections, and in particular, sidewalks are provided along Imperial Highway and S. Associated Road bordering the site. Furthermore, crosswalks are provided at each of the study intersections to provide connectivity across the streets that border the site. With the current pedestrian system now in place, access to and from the project site is adequate and will continue to serve the proposed Project. The proposed Project will protect the existing sidewalks, and if necessary, repair or construct new sidewalks along the project frontage per the City's request.

In addition to pedestrian connectivity, an existing Class II bike lane is provided along S. Associated Road, which connects to other nearby bicycle facilities including the existing Class II bike lane on Birch Street as well as the Class I bike trail (The Tracks at Brea Trail). Furthermore, the General Plan identifies an extension of the Class II bike lane along Birch Street, west of State College Boulevard, as well as the installation of a Class II bike lane along State College Boulevard. The proposed Project will continue to support and encourage bike mobility by providing both long-term and short-term bicycle parking spaces on-site to accommodate different types of bicycles (e.g. cargo bike, bike with trailer, etc.)

Parking				
▪ 3-Level Parking Structure	--		387 spaces and 10 tandem stalls	387 spaces and 10 tandem stalls
▪ Surface Parking	725 spaces[3]	116 spaces	--	609 spaces
Total Parking	**725 spaces**	**116 spaces**	**387 spaces and 10 tandem stalls**	**996 spaces and 10 tandem stalls**

1 Project development summary is based on the proposed project site plan prepared by Architects Orange, dated February 10, 2021.

2 There is a total of 189 apartment units. A portion of the proposed apartments are considered co-living units, which include five (5) 3-bedroom units and ten (10) 4-bedroom units. Therefore, to provide a conservative assessment, the co-living unit bedrooms have been counted as individual units for a total apartment count of 229 units.

3 Currently, there are a total of 725 parking stalls plus an additional 180 spaces during business hours and all surface spaces after 5PM and weekend through an easement with Mercury Insurance. However, the easement with Mercury Insurance will no longer be applicable as part of the proposed Project and all of the project parking demands will be accommodated on-site.

3.0 EXISTING CONDITIONS

3.1 Existing Street System

The principal local network of streets serving the project site includes Birch Street, Imperial Highway, and S. Associated Road. The following discussion provides a brief synopsis of these key area streets. The descriptions are based on an inventory of existing roadway conditions.

Birch Street is a four-lane, divided roadway oriented in the east-west direction. The posted speed limit on Birch Street is 35 miles per hour (mph) west of State College Boulevard, 45 mph between State College Boulevard and S. Associated Road and 50 mph east of S. Associated Road. On-street parking is not permitted along this roadway. Birch Street is designated as a Primary Arterial in the City's Master Plan of Roadways. A traffic signal controls the study intersection of Birch Street at S. Associated Road.

Imperial Highway is a six-lane, divided roadway generally oriented in the east-west direction. The posted speed limit on Imperial Highway is 45 mph west of the SR-57 Freeway and 50 mph east of the SR-57 Freeway. On-street parking is not permitted along this roadway. Imperial Highway is designated as a Smart Street in the City's Master Plan of Roadways. A traffic signal controls the study intersections of Imperial Highway at SR-57 SB Ramps, SR-57 NB Ramps, S. Associated Road, and Castlegate Lane/Placentia Avenue. All signalized intersections along Imperial Highway are owned and operated by Caltrans.

S. Associated Road is a four-lane, divided roadway generally oriented in the north-south direction. The posted speed limit on S. Associated Road is 40mph. On-street parking is not permitted along this roadway. S. Associated Road is designated as a Secondary Arterial in the City's Master Plan of Roadways. Traffic signals control the study intersections of S. Associated Road at Birch Street, Greenbriar Lane and Imperial Highway.

Figure 3-1 presents an inventory of the existing roadway conditions for the arterials and intersections evaluated in this report. This figure identifies the number of travel lanes for key arterials, as well as intersection configurations and controls for the study intersections.

3.2 Existing Public Transit

Public transit bus service is provided in the project area by the Orange County Transportation Authority (OCTA). Four (4) OCTA bus routes operate within the vicinity of the Project site on Birch Street, S. Associated Road, Brea Boulevard, and State College Boulevard, which consist of the following:

- OCTA Route 57 (Brea to Newport Beach): Route 57 is a local bus route serving the Cities of Brea, Fullerton, Anaheim, Orange, Santa Ana, Costa Mesa, and Newport Beach. The major routes of travel include State College Boulevard and Bristol Street. Nearest to the project site are bus stops along State College Boulevard at the intersection of Imperial Highway. Route 57 operates on approximate 15-minute headways during weekdays and weekends.

BREA PLAZA EXPANSION PROJECT, BREA

- OCTA Route 129 (La Habra to Anaheim): Route 129 is a community bus route serving the Cities of Anaheim, Placentia, Yorba Linda, Brea, and La Habra. The major routes of travel include La Habra Boulevard, Brea Boulevard, Birch Street, and Kraemer Boulevard. Nearest to the project site are bus stops along Birch Street and S. Associated Road. Route 129 operates on approximate 45-minute headways during weekdays and 60-minute headways on weekends.

- OCTA Route 143 (La Habra to Brea): Route 143 is a community bus route serving the Cities of Fullerton, Brea, and La Habra. The major routes of travel include Whittier Boulevard, Harbor Boulevard, Brea Boulevard, and Birch Street. Nearest to the project site are bus stops on Birch Street at State College Boulevard, and at Brea Mall. Route 143 operates on approximate 75-minute headways during weekdays and 65-minute headways on weekends.

- OCTA Route 153 (Brea to Anaheim): Route 153 is a community bus route serving the Cities of Brea, Placentia, Fullerton, Anaheim, and Orange. The major routes of travel include Placentia Avenue. Nearest to the project site are bus stops on S. Associated Road at Greenbriar Lane and on S. Associated Road at Imperial Highway. Route 153 operates on approximate 60-minute headways during weekdays and weekends.

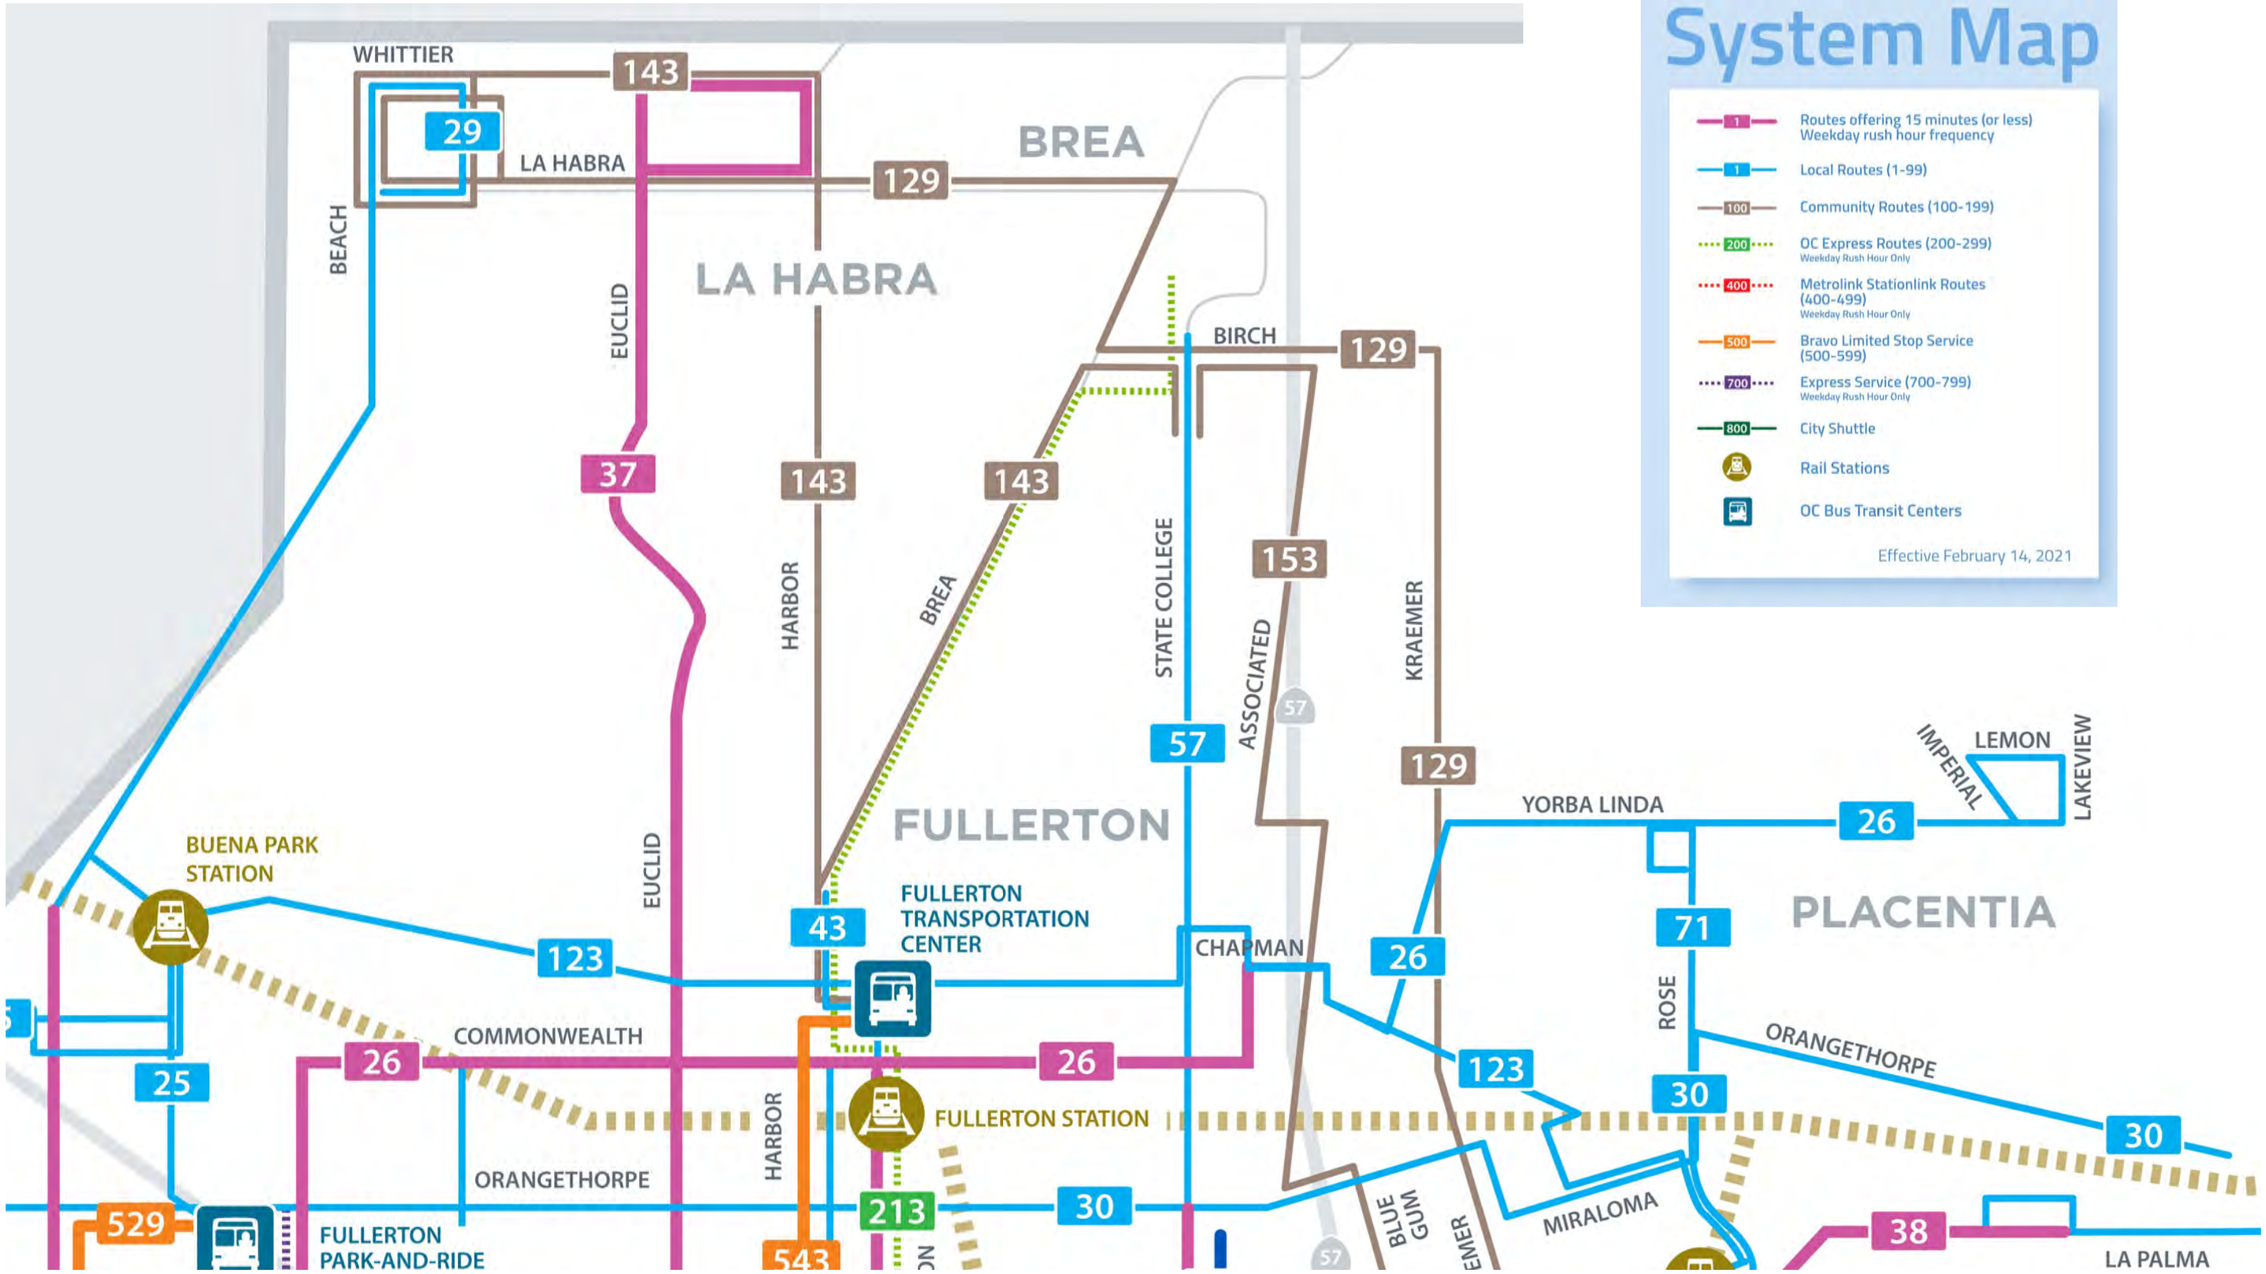
Figure 3-2 graphically illustrates the transit routes of OCTA within the vicinity of the Project site. ***Figure 3-3*** identifies the location of the existing bus stops in proximity to the Project site.

3.3 Existing Bikeway Plan

The City of Brea promotes bicycling as a means of mobility and a way in which to improve the quality of life within its community. The Bikeway Plan recognizes the needs of bicycle users and aims to create a complete and safe bicycle network throughout the City. The City of Brea Bike Plan (existing and proposed) is shown on ***Figure 3-4***. In close proximity to the site are existing Class II bike lanes provided along Birch Street, east of State College Boulevard, and on S. Associated Road, as well as a Class I bike trail (The Tracks at Brea Trail). There are proposed Class II bike lanes along Birch Street, west of State College Boulevard, and on State College Boulevard.

3.4 Existing Traffic Volumes

Due to the Covid-19 virus, the Governor of California has issued a state-wide "stay at home" order which has ultimately resulted in a decrease in traffic. Based on these current conditions, the ability to collect traffic counts to establish baseline conditions that would be reflective of traffic conditions without "stay at home" orders in effect are not possible. As such, to establish "baseline" traffic conditions, pre-Covid-19 (i.e. under normal circumstances without "stay at home" orders in effect), LLG has researched historic data and was able to obtain Year 2018/2019 counts at five (5) of the study locations as summarized below:



System Map

- Routes offering 15 minutes (or less) Weekday rush hour frequency
- Local Routes (1-99)
- Community Routes (100-199)
- OC Express Routes (200-299) Weekday Rush Hour Only
- Metrolink Stationlink Routes (400-499) Weekday Rush Hour Only
- Bravo Limited Stop Service (500-599)
- Express Service (700-799) Weekday Rush Hour Only
- City Shuttle
- Rail Stations
- OC Bus Transit Centers

Study Intersection		Historic Traffic Counts Available?	Collected Year 2020 Covid-19 Traffic Counts?
1.	SR-57 SB Ramps at Imperial Highway	Yes	--
2.	SR-57 NB Ramps/Brea Plaza Driveway 1 at Imperial Highway	Yes	--
3.	S. Associated Road at Birch Street	Yes	--
4.	S. Associated Road at Greenbriar Lane	**No**	**Yes**
5.	S. Associated Road at Imperial Highway	Yes	**Yes**
6.	Castlegate Lane/Placentia Avenue at Imperial Highway	Yes	**Yes**
7.	S. Associated Road at Brea Plaza Driveway 2	--	--
8.	S. Associated Road at Brea Plaza Driveway 3	--	--
9.	Brea Plaza Driveway 4 at Imperial Highway	--	--

Given the availability of historic data, the following steps were used to establish Existing Year 2021 pre-Covid-19 baseline traffic conditions:

(1) Historic data is available at five (5) locations for Year 2018/2019.

(2) Given data is not available at one (1) study location (Intersection #4 – not including the existing Brea Plaza driveways), LLG collected Year 2020 Covid-19 traffic counts at the study location, as well as intersections adjacent to the missing intersections, in October 2020 for use in establishing traffic counts/turning movement percentages.

(3) Using information from (1) and (2), compare 2018/2019 to 2020 to establish change in traffic counts due to current COVID-19 environment.

(4) Apply the rate calculated in (3) to 2020 COVID-19 traffic counts and forecast 2018/2019 traffic conditions at the one (1) missing intersection (Intersection #4).

(5) Lastly, apply an annual growth factor of 1% per year to the Year 2018/2019 traffic conditions to establish Year 2021 pre-COVID-19 baseline traffic conditions.

Additionally, the existing ingress and egress volumes for the Brea Plaza driveways (Intersections 2, 7, 8 and 9) were based on forecasted trips for the existing center rather than applying adjustments in place of collecting traffic counts.

Figures 3-5 and ***3-6*** illustrate the existing Year 2021 weekday AM and PM peak hour traffic volumes at the nine (9) study intersections evaluated in this report, respectively. *Figure 3-6* also presents the existing average weekday daily traffic volumes for the seven (7) roadway segments in the vicinity of the proposed Project.

EXISTING PM PEAK HOUR AND DAILY TRAFFIC VOLUMES

BREA PLAZA EXPANSION PROJECT, BREA

Appendix B contains a summary table for the Year 2021 pre-Covid-19 baseline volume development as well as the detailed peak hour and daily traffic count sheets for the study intersections and roadway segments evaluated in this report.

3.5 Level of Service (LOS) Analysis Methodologies

Existing weekday AM and PM peak hour operating conditions for the study intersections were evaluated using the *Intersection Capacity Utilization* (ICU) methodology for signalized intersections as well as the methodology outlined in the *Highway Capacity Manual*. Per the City's direction, the Intersection Capacity Utilization (ICU) method will be used for the purpose of consistency with the City of Brea General Plan.

3.5.1 *Intersection Capacity Utilization (ICU) Method of Analysis*

Weekday AM and PM peak hour operating conditions for the signalized study intersections were evaluated using the Intersection Capacity Utilization (ICU) method. The ICU technique is intended for signalized intersection analysis and estimates the volume to capacity (V/C) relationship for an intersection based on the individual V/C ratios for key conflicting traffic movements. The ICU numerical value represents the percent signal (green) time, and thus capacity, required by existing and/or future traffic. It should be noted that the ICU methodology assumes uniform traffic distribution per intersection approach lane and optimal signal timing.

Per City of Brea requirements, the ICU calculations use a lane capacity of 1,700 vehicles per hour (vph) for through and all turn lanes. A clearance adjustment factor of 0.05 was added to each Level of Service calculation.

The ICU value translates to a Level of Service (LOS) estimate, which is a relative measure of the intersection performance. The ICU value is the sum of the critical volume to capacity ratios at an intersection; it is not intended to be indicative of the LOS of each of the individual turning movements. The six qualitative categories of Level of Service have been defined along with the corresponding ICU value range and are shown in ***Table 3-1***.

3.5.2 *Highway Capacity Manual (HCM) Method of Analysis (Signalized Intersections)*

Weekday AM and PM peak hour operating conditions for study intersections were evaluated using the methodology outlined in *Chapter 19 of the Highway Capacity Manual 6 (HCM 6)* for signalized intersections.

Based on the HCM operations method of analysis, level of service for signalized intersections and approaches is defined in terms of control delay, which is a measure of the increase in travel time due to traffic signal control, driver discomfort, and fuel consumption. Control delay includes the delay associated with vehicles slowing in advance of an intersection, the time spent stopped on an intersection approach, the time spent as vehicles move up in the queue, and the time needed for vehicles to accelerate to their desired speed. LOS criteria for traffic signals are stated in terms of the control delay in seconds per vehicle. The LOS thresholds established for the automobile mode at a signalized intersection are shown in ***Table 3-2***.

3.5.3 *Highway Capacity Manual (HCM) Method of Analysis (Unsignalized Intersections)*

The HCM unsignalized methodology for stop-controlled intersections was utilized for the analysis of the unsignalized intersections. LOS criteria for unsignalized intersections differ from LOS criteria for signalized intersections as signalized intersections are designed for heavier traffic and therefore a greater delay. Unsignalized intersections are also associated with more uncertainty for users, as delays are less predictable, which can reduce users' delay tolerance.

Two-way stop-controlled intersections are comprised of a major street, which is uncontrolled, and a minor street, which is controlled by stop signs. Level of service for a two-way stop-controlled intersection is determined by the computed or measured control delay. The control delay by movement, by approach, and for the intersection as a whole is estimated by the computed capacity for each movement. LOS is determined for each minor-street movement (or shared movement) as well as major-street left turns. The worst side street approach delay is reported. LOS is not defined for the intersection as a whole or for major-street approaches, as it is assumed that major-street through vehicles experience zero delay. The HCM control delay value range for two-way stop-controlled intersections is shown in ***Table 3-3***.

3.6 Level of Service Criteria

According to City of Brea, LOS D is the minimum acceptable condition that should be maintained during the weekday morning and evening peak commute hours at arterial intersections. LOS E is the minimum acceptable condition that should be maintained during the weekday morning and evening peak commute hours for Orange County CMP designated intersections. Based on the above, the following is the LOS required for each intersection:

LOS "D" Requirements – Study Intersections

3. S. Associated Road at Birch Street
4. S. Associated Road at Greenbriar Lane
5. S. Associated Road at Imperial Highway (Caltrans)
6. Castlegate Lane/Placentia Avenue at Imperial Highway (Caltrans)
7. S. Associated Road at Brea Plaza Driveway 2
8. S. Associated Road at Brea Plaza Driveway 3
9. Brea Plaza Driveway 4 at Imperial Highway (Caltrans)

LOS "E" Requirements – Study Intersections

1. SR-57 SB Ramps at Imperial Highway (Caltrans)
2. SR-57 NB Ramps/Brea Plaza Driveway 1 at Imperial Highway (Caltrans)

TABLE 3-1

LEVEL OF SERVICE CRITERIA FOR SIGNALIZED INTERSECTIONS (ICU METHODOLOGY)

Level of Service (LOS)	Intersection Capacity Utilization Value (V/C)	Level of Service Description
A	≤ 0.600	EXCELLENT. No vehicle waits longer than one red light, and no approach phase is fully used.
B	0.601 – 0.700	VERY GOOD. An occasional approach phase is fully utilized; many drivers begin to feel somewhat restricted within groups of vehicles.
C	0.701 – 0.800	GOOD. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.
D	0.801 – 0.900	FAIR. Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.
E	0.901 – 1.000	POOR. Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles.
F	> 1.000	FAILURE. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Potentially very long delays with continuously increasing queue lengths.

TABLE 3-2

LEVEL OF SERVICE CRITERIA FOR SIGNALIZED INTERSECTIONS (HCM METHODOLOGY)[4]

Control Delay (sec/veh)	Level of Service (LOS)	Level of Service Description
≤ 10	A	This level of service occurs when the v/c ratio is low and either progression is exceptionally favorable or the cycle length is very short.
> 10-20	B	This level generally occurs when the v/c ratio is low and either progression is highly favorable or the cycle length is short.
> 20-35	C	Average traffic delays. These higher delays may result when progression is favorable or the cycle length is moderate. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant at this level, though many still pass through the intersection without stopping.
> 35-55	D	Long traffic delays. At level D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high *v/c* ratios. Many vehicles stop and individual cycle failures are noticeable.
> 55-80	E	Very long traffic delays. This level is considered by many agencies to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high *v/c* ratios. Individual cycle failures are frequent.
> 80	F	Severe congestion. This level, considered to be unacceptable to most drivers, often occurs with over saturation, that is, when arrival flow rates exceed the capacity of the intersection. It may also occur at high *v/c* ratios below 1.0 with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing factors to such delay levels.

[4] Source: *Highway Capacity Manual*, Chapter 18: Signalized Intersections.

TABLE 3-3

LEVEL OF SERVICE CRITERIA FOR UNSIGNALIZED INTERSECTIONS (HCM)[5]

Level of Service (LOS)	Highway Capacity Manual Delay Value (sec/veh)	Level of Service Description
A	≤ 10.0	Little or no delay
B	> 10.0 and ≤ 15.0	Short traffic delays
C	> 15.0 and ≤ 25.0	Average traffic delays
D	> 25.0 and ≤ 35.0	Long traffic delays
E	> 35.0 and ≤ 50.0	Very long traffic delays
F	> 50.0	Severe congestion

3.7 Existing Level of Service Results

3.7.1 *Existing Conditions Intersection Capacity Analysis (ICU Methodology)*

Table 3-4 summarizes the existing peak hour service level calculations for the six (6) signalized study intersections evaluated under ICU analysis based on existing traffic volumes and current street geometrics. Review of *Table 3-4* indicates that all of the signalized study intersections currently operate at acceptable service levels during the weekday AM and PM peak hours.

Appendix C presents the ICU LOS calculation worksheets for the study intersections.

3.7.2 *Existing Conditions Intersection Capacity Analysis (HCM Methodology)*

Table 3-5 summarizes the existing peak hour service level calculations for the nine (9) study intersections evaluated under HCM analysis based on existing traffic volumes and current street geometrics. Review of *Table 3-5* indicates that all of the study intersections currently operate at acceptable service levels during the weekday AM and PM peak hours.

Appendix D presents the HCM LOS calculation worksheets for the study intersections.

- ∅ = Phase

4.0 TRAFFIC FORECASTING METHODOLOGY

In order to estimate the traffic characteristics of the proposed Project, a multi-step process has been utilized. The first step is traffic generation, which estimates the total arriving and departing traffic on a peak hour and daily basis. The traffic generation potential is forecast by applying the appropriate vehicle trip generation equations or rates to the project development tabulation.

The second step of the forecasting process is traffic distribution, which identifies the origins and destinations of inbound and outbound project traffic. These origins and destinations are typically based on demographics and existing/expected future travel patterns in the study area.

The third step is traffic assignment, which involves the allocation of project traffic to study area streets and intersections. Traffic assignment is typically based on minimization of travel time, which may or may not involve the shortest route, depending on prevailing operating conditions and travel speeds. Traffic distribution patterns are indicated by general percentage orientation, while traffic assignment allocates specific volume forecasts to individual roadway links and intersection turning movements throughout the study area.

With the forecasting process complete and project traffic assignments developed, the proposed project is isolated by comparing operational (LOS) conditions at selected study intersections using expected future traffic volumes with and without forecast project traffic. The need for site-specific and/or cumulative local area traffic improvements can then be evaluated.

5.0 PROJECT TRAFFIC CHARACTERISTICS

5.1 Project Traffic Generation

Traffic generation is expressed in vehicle trip ends, defined as one-way vehicular movements, either entering or exiting the generating land use. The trip generation potential of the proposed Project will be estimated using trip rates contained in the 10th Edition of *Trip Generation,* published by the Institute of Transportation Engineers (ITE), [Washington, D.C., 2017].

Table 5-1 summarizes the trip generation rates used in forecasting the vehicular trips generated by the proposed Project based on the entire Brea Plaza retail center and also presents the proposed project's forecast peak hour and daily traffic volumes. As shown in the upper portion of *Table 5-1,* ITE Land Use 221: Multifamily Housing (Mid-Rise), ITE 444: Movie Theater, ITE 710: General Office Building, and ITE 820: Shopping Center trip rates will be used to forecast the trip generation potential of the proposed Project, as well as the trip generation potential of a fully occupied existing Brea Plaza.

A review of the middle portion of *Table 5-1* indicates that a fully occupied Brea Plaza is forecast to generate approximately 8,963 daily trips, with 202 trips (126 inbound, 76 outbound) produced in the AM peak hour and 576 trips (283 inbound, 293 outbound) produced in the PM peak hour on a "typical" weekday, and 12,644 daily trips with 1,261 trips (646 inbound, 615 outbound) produced in the Midday peak hour on a "typical" Saturday.

A review of the lower portion of *Table 5-1* indicates that the trip generation associated with Brea Plaza upon implementation of the proposed Project is forecast to generate approximately 7,283 daily trips, with 302 trips (165 inbound, 137 outbound) produced in the AM peak hour and 516 trips (250 inbound, 266 outbound) produced in the PM peak hour on a "typical" weekday, and 10,362 daily trips with 772 trips (370 inbound, 402 outbound) produced in the Midday peak hour on a "typical" Saturday.

When the existing Brea Plaza is compared to the retail center with the proposed Project, the implementation of the proposed Project is forecast result in 1,680 *fewer* weekday daily trips, 100 *more* weekday AM peak hour trips, and 60 *fewer* weekday PM peak hour trips, as well as 2,282 *fewer* Saturday daily trips, and 489 *fewer* Saturday midday peak hour trips. As a result of trips documented in *Table 5-1,* which identifies changes to the Saturday daily and peak hour trips, a Saturday analysis is not recommended. Therefore, this traffic analysis will be based on the net AM peak hour and PM peak hour project trips.

5.2 Project Traffic Distribution and Assignment

Figures 5-1 through ***5-4*** presents the project trip distribution for the existing retail land uses, proposed retail land uses, proposed residential, and proposed office, respectively. The project trip distributions have been distributed and assigned to the adjacent street system based on the following considerations:

- location of site access points in relation to the surrounding street system,
- the site's proximity to major traffic carriers and regional access routes,
- physical characteristics of the circulation system such as lane channelization and presence of traffic signals that affect travel patterns,
- presence of traffic congestion in the surrounding vicinity, and
- ingress/egress availability at the project site.

The anticipated weekday AM and PM peak hour project traffic volumes associated with the proposed Project are presented in ***Figures 5-5*** and ***5-6***, respectively. *Figure 5-6* also presents the weekday daily Project traffic volumes. The traffic volume assignments presented in *Figures 5-5* and *5-6* reflect the traffic distribution characteristics shown in *Figures 5-1* through *5-4* and the traffic generation forecast presented in *Table 5-1*.

Notes:

- TE/TSF = Trip End per Thousand Square Feet Gross Leasable Area
- TE/DU = Trip End per Dwelling Unit
- TE/Seat = Trip End per Seat

6 Source: *Trip Generation*, 10th Edition, Institute of Transportation Engineers (ITE), Washington, D.C. (2017).

7 Trip Generation rates based on the following equations:

- Weekday Daily: Ln(T) = 0.68Ln(X) + 5.57
- Weekday AM Peak Hour: T = 0.50(X) + 151.78
- Weekday PM Peak Hour: Ln(T) = 0.74Ln(X) + 2.89
- Saturday Daily: Ln(T) = 0.62Ln(X) + 6.24
- Saturday Peak Hour of Generator: Ln(T) = 0.79Ln(X) + 2.79

8 Pass-By Trips are trips made as intermediate stops on the way from an origin to a primary trip destination. Pass-by trips are attracted from traffic passing the site on adjacent streets, which contain direct access to the generator. For this analysis, the following pass-by reduction factors were used (Source: *Trip Generation Handbook,3rd Edition*, ITE 2017):

- 820: Shopping Center: PM Peak Hour – 34%, Daily/AM peak hour/Saturday Daily/Saturday Midday Peak Hour – Assume 10%

9 Consistent with the *Trip Generation Handbook,* published by ITE (2017), Project trip generation was adjusted to account for internal capture between the retail and residential components of the Project. As there are no Saturday internal capture worksheets available, Weekday Daily and Weekday PM peak hour calculations have been applied to Saturday Daily and Saturday Midday peak hour.

6.0 FUTURE TRAFFIC CONDITIONS

6.1 Ambient Traffic Growth

Horizon year, background traffic growth estimates have been calculated using an ambient traffic growth factor. The ambient traffic growth factor is intended to include unknown and future related projects in the study area, as well as account for regular growth in traffic volumes due to the development of projects outside the study area. The future growth in traffic volumes has been calculated at one percent (1.0%) per year. Applied to the Year 2021 existing traffic volumes, this factor results in a 3.0% growth in existing volumes to the near-term horizon year 2024.

6.2 Related Projects Traffic Characteristics

In order to make a realistic estimate of future on-street conditions prior to implementation of the proposed Project, the status of other known development projects (related projects) within the area of the proposed project has been researched at the Cities of Brea, Placentia, and Fullerton. With this information, the proposed Project can be evaluated within the context of the cumulative setting.

Based on our research during the scoping process, there are twelve (12) related projects in the City of Brea and two (2) related projects in the City of Fullerton that are being processed for approval. All of these related projects have been included as part of the cumulative background setting.

Table 6-1 provides a brief description for each of the fourteen (14) related projects. ***Figure 6-1*** graphically illustrates the location of the fourteen (14) related projects. These related projects are expected to generate vehicular traffic, which may affect the operating conditions of the study intersections.

Table 6-2 summarizes the trip generation potential for the fourteen (14) related projects on a weekday daily and peak hour basis. As shown, the related projects are expected to generate 35,920 weekday daily trips, with 2,713 trips (1,312 inbound, 1,401 outbound) anticipated during the AM peak hour and 3,274 trips (1,709 inbound, 1,565 outbound) produced during the PM peak hour.

The weekday AM and PM peak hour traffic volumes associated with thirteen (13) of the fourteen (14) related projects in the Year 2024 are presented in ***Figures 6-2*** and ***6-3***, respectively. *Figure 6-3* also presents the weekday daily related project traffic volumes. It should be noted that the Brea 265 Specific Plan Project has been included as a related project only under Year 2045 background traffic conditions.

TABLE 6-1

LOCATION AND DESCRIPTION OF CUMULATIVE PROJECTS[10]

No.	Description	Location/Address	Size
City of Brea			
1.	CVS	390 N. Brea Boulevard	13,000 SF Pharmacy with Drive-Through, 1,700 SF Coffee Shop with Drive-through
2.	Brea Place	State College Boulevard at Birch Street	653 DU Apartments, 5,000 SF Office, 150 Room Hotel[11]
3.	Downtown Hotel	220 S. Brea Boulevard	116 Room Hotel, 4,000 SF High Turnover Sit Down Restaurant
4.	Mercury Apartments	Southwest corner of Berry Street at Mercury Lane	120 DU Apartments
5.	Brea Mall Mixed-Use Project	1065 Brea Mall	Demolish existing 161,990 SF Sears department store and develop 183,615 SF retail space inclusive of a 50,019 SF sporting goods store and a 128,000 SF health club, and a 312 DU apartment building
6.	Brea 265 Specific Plan[12]	South of Lambert Road/Carbon Canyon Road, north of Rose Drive, east of Valencia Avenue and west of Carbon Canyon Regional Park	1,100 residential units, consisting of 606 single-family homes and 494 multi-family residential units.
7.	Central Park Village	340-420 W. Central Avenue	62 DU townhomes and 20 DU apartments[13]
8.	New Industrial Building	201 N. Berry Street	108,125 SF warehouse
9.	Alvero Assisted Living	251 S. Randolph Avenue	80 rooms with 82 beds residential care facility
10.	Extra Space Self Storage	2700 E. Imperial Highway	126,546 self-storage facility
11.	Brea Imperial Center	391 S. State College Boulevard	5,000 SF restaurant, 2,300 SF bagel/coffee shop, 1,600 SF café, 3,867 SF In-N-Out, 28,145 SF retail, and 4,400 SF bank to replace existing land uses which include 4,050 SF food uses, 24,481 SF retail, 4,400 SF bank, 2,325 SF medical office, 10,074 SF health studio spa.
12.	Transwestern	285 S. Berry Street and 711 W. Imperial Highway	132,700 SF warehouse
City of Fullerton			
13.	3105 Yorba Linda Boulevard	3105 Yorba Linda Boulevard	4,840 SF drive-through car wash
14.	Beckman Business Center	4300 North Harbor Boulevard	522,250 SF Warehousing, 166,185 SF General Light Industrial, 105,880 SF Manufacturing, 42,000 SF Office, and 142,350 SF fulfillment center

[10] Source: City of Brea and Fullerton Planning Departments.

[11] The traffic impact analysis conservatively evaluated 790 units as originally planned, which would result in higher traffic volumes in the cumulative scenarios.

[12] Brea 265 Specific Plan Project has been included as a related project as part of Year 2045 General Plan Buildout background traffic conditions.

[13] The project has already built and occupied 206 DU apartments and 83 DU townhomes.

6.3 Year 2045 General Plan Buildout Traffic Conditions

As coordinated with City staff, the Year 2045 General Plan Buildout traffic volume forecasts for this traffic study were developed via the utilization of the OCTAM 5.0 Year 2045 traffic model. Specifically, daily, AM peak period and PM peak period link traffic volumes were provided for the existing base year (i.e. Year 2016) and for the Year 2045. The AM peak period corresponds to a three-hour morning commute period while the PM peak period corresponds to a four-hour afternoon commute period. Using the peak period model runs and the approved peak hour factors (i.e. AM = 0.3566 and PM = 0.2662), the one-hour peak hour link traffic volumes were determined. These future year 2045 link traffic volumes were post-processed based on the relationship of the base year validation model run output to the base year ground traffic counts resulting in anticipated Year 2045 without project daily traffic volumes for the roadway segments and AM peak hour/PM peak hour turning movements for the study intersections.

Appendix E presents the post-processing worksheets.

6.4 Year 2024 and Year 2045 Traffic Volumes

6.4.1 *Year 2024 Traffic Volumes*

Figures 6-4 and ***6-5*** present the weekday AM and PM peak hour cumulative traffic volumes (existing traffic + ambient growth + related projects) at the nine (9) study intersections for the Year 2024, respectively. *Figure 6-5* also presents the Year 2024 daily cumulative traffic volumes.

Figures 6-6 and ***6-7*** illustrate the Year 2024 forecast AM and PM peak hour traffic volumes, with the inclusion of the trips generated by the proposed Project, respectively. *Figure 6-7* also presents the Year 2024 daily cumulative plus project traffic volumes.

6.4.2 *Year 2045 General Plan Buildout Traffic Volumes*

Figures 6-8 and ***6-9*** present the anticipated Year 2045 General Plan Buildout AM and PM peak hour cumulative traffic volumes at the nine (9) study intersections, respectively. *Figure 6-9* also presents the Year 2045 daily cumulative traffic volumes.

Figures 6-10 and ***6-11*** illustrate the anticipated Year 2045 General Plan Buildout forecast AM and PM peak hour traffic volumes, with the inclusion of the trips generated by the proposed Project, respectively. *Figure 6-11* also presents the Year 2045 daily cumulative plus project traffic volumes.

FIGURE 6-11

YEAR 2045 GENERAL PLAN BUILDOUT PLUS PROJECT PM PEAK HOUR AND DAILY TRAFFIC VOLUMES

BREA PLAZA EXPANSION PROJECT, BREA

7.0 TRAFFIC ANALYSIS METHODOLOGY

7.1 Level of Service Consequences and Thresholds

The potential LOS consequences of the added project traffic volumes generated by the proposed Project during the weekday peak hours was evaluated based on analysis of future operating conditions at the nine (9) study intersections, without, then with, the proposed Project. The previously discussed capacity analysis procedures were utilized to investigate the future volume-to-capacity relationships and service level characteristics at each study intersection. The consequence of added project-related peak hour traffic on the LOS at each study intersection then evaluated using the following criteria.

7.1.1 *City of Brea*

For the ICU analysis, the need for potential Project-related improvements will be assessed based on the following criteria:

- The Project causes an intersection operating at LOS D or better to degrade to LOS E or F, or
- The Project increases traffic demand at a signalized study intersection by 0.020 or greater and the intersection is forecast to operate at LOS E or F.

For the HCM analysis, the need for potential Project-related improvements will be assessed based on the following criteria:

- The Project causes one or more study intersections operating at LOS D or better to degrade to LOS E or F, or
- The Project causes a change in control delay of 4 seconds for intersections already operating at LOS E, or
- The Project causes a change in control delay of 2 seconds for intersections already operating at LOS F.

7.2 Traffic Analysis Scenarios

The following scenarios are those for which volume/capacity calculations have been performed at the nine (9) study intersections for existing, near-term (Year 2024) and General Plan Buildout (Year 2045) traffic conditions:

1. Existing (Year 2021) Traffic Conditions;
2. Near-Term (Year 2024) Background Traffic Conditions (Existing plus Ambient Growth plus Related Projects);
3. Near-Term (Year 2024) Background Plus Project Traffic Conditions;
4. Scenario (3) with improvements to be implemented as conditions of approval (COA), if necessary;
5. General Plan Buildout[19] (Year 2045) Traffic Conditions;

[19] It should be noted that the General Plan Buildout assessment has been included since the proposed Project would require an amendment to the General Plan to accommodate a change is Zoning to allow for residential uses.

6. General Plan Buildout (Year 2045) Plus Project Traffic Conditions; and
7. Scenario (6) with improvements to be implemented as conditions of approval (COA), if necessary.

7.3 City of Brea Nexus Program

To satisfy the AB 1600 legislative requirement, development impact fees have been established for future traffic improvements within the City of Brea. Ensuring that every development project contributes a fair share of transportation improvements in the community, the City has introduced the "Transportation Improvement Nexus Program". In 2011, the Nexus Program was updated to reflect transportation needs and incorporate capacity improvements in an orderly fashion. The program ensures all future development with the City of Brea contributes on a fair share basis.

8.0 PEAK HOUR INTERSECTION CAPACITY ANALYSIS

8.1 Year 2024 Traffic Conditions - ICU

Table 8-1 summarizes the peak hour Level of Service results at the six (6) signalized study intersections evaluated under ICU analysis for the Year 2024 horizon year. The first column (1) of ICU/LOS values in *Table 8-1* presents a summary of existing peak hour traffic conditions. The second column (2) lists projected cumulative traffic conditions (existing plus ambient plus related projects traffic) based on existing intersection geometry, but without any traffic generated from the proposed Project. The third column (3) presents forecast Year 2024 near-term traffic conditions with the addition of Project traffic. The fourth column (4) shows the increase in ICU value due to the added peak hour Project trips and indicates whether the traffic associated with the proposed Project will exceed the LOS thresholds defined in this report. The fifth column (5) presents the resultant level of service with the inclusion of recommended traffic improvements, where needed, to achieve an acceptable level of service.

8.1.1 *Year 2024 Cumulative Traffic Conditions - ICU*

Review of column (2) of *Table 8-1* indicates that all of the signalized study intersections are forecast to operate at acceptable LOS D or better during the weekday AM and PM peak hours under Year 2024 cumulative traffic conditions.

8.1.2 *Year 2024 Cumulative Plus Project Conditions - ICU*

Review of columns (3) and (4) of *Table 8-1* indicates that all of the signalized study intersections are forecast to operate at acceptable LOS D or better during the weekday AM and PM peak hours with the addition of proposed Project traffic to Year 2024 cumulative traffic.

Appendix C presents the ICU LOS calculation worksheets for the study intersections.

TABLE 8-1

YEAR 2024 PEAK HOUR INTERSECTION CAPACITY ANALYSIS - ICU

Study Intersection	Minimum Acceptable LOS	Time Period	(1) Existing Traffic Conditions		(2) Year 2024 Cumulative Traffic Conditions		(3) Year 2024 Cumulative Plus Project Traffic Conditions		(4) Exceed LOS Thresholds		(5) Year 2024 Cumulative Plus Project Plus Improvements Traffic Conditions	
			ICU	LOS	ICU	LOS	ICU	LOS	Increase	Yes/No	ICU	LOS
1. SR-57 SB Ramps at Imperial Highway	E	AM	0.558	A	0.638	B	0.644	B	0.006	No	--	--
		PM	0.680	B	0.764	C	0.760	C	-0.004[20]	No	--	--
2. SR-57 NB Ramps/Brea Plaza Driveway 1 at Imperial Highway	E	AM	0.557	A	0.615	B	0.604	B	-0.011[21]	No	--	--
		PM	0.693	B	0.758	C	0.741	C	-0.017[21]	No	--	--
3. S. Associated Road at Birch Street	D	AM	0.603	B	0.628	B	0.631	B	0.003	No	--	--
		PM	0.602	B	0.625	B	0.625	B	0.000	No	--	--
4. S. Associated Road at Greenbriar Lane	D	AM	0.262	A	0.269	A	0.313	A	0.044	No	--	--
		PM	0.286	A	0.296	A	0.339	A	0.043	No	--	--

		PM	0.763	C	0.800	D	0.801	D	0.001	No	--	--
6. Placentia Avenue/Castlegate Lane at Imperial Highway	D	AM	0.590	A	0.615	B	0.616	B	0.001	No	--	--
		PM	0.684	B	0.716	C	0.715	C	-0.001[20]	No	--	--
7. S. Associated Road at Brea Plaza Driveway 2	D	AM	--	--	--	--	--	--	--	--	--	--
		PM	--	--	--	--	--	--	--	--	--	--

Notes:

- **Bold ICU/LOS** values indicate adverse service levels based on the City LOS standards.

[20] A reduction in delay is due to the negative net project volumes during the PM peak hour only.

[21] A reduction in delay is due to the shifting of volumes going to/from the Mercury Insurance site under Project conditions. Currently, cross-access between Mercury Insurance and Brea Plaza is currently allowed, however, the easement with Mercury Insurance will no longer be applicable as part of the proposed Project. Employees/patrons of Mercury Insurance will be expected to utilize Greenbriar Road to access their site rather than cutting through Brea Plaza. The reduction in delay is also due to the negative net project volumes during the PM peak hour only.

TABLE 8-1 (CONTINUED)

YEAR 2024 PEAK HOUR INTERSECTION CAPACITY ANALYSIS - ICU

Study Intersection	Minimum Acceptable LOS	Time Period	(1) Existing Traffic Conditions		(2) Year 2024 Cumulative Traffic Conditions		(3) Year 2024 Cumulative Plus Project Traffic Conditions		(4) Exceed LOS Thresholds		(5) Year 2024 Cumulative Plus Project Plus Improvements Traffic Conditions	
			ICU	LOS	ICU	LOS	ICU	LOS	Increase	Yes/No	ICU	LOS
8. S. Associated Road at Brea Plaza Driveway 3	D	AM	--	--	--	--	--	--	--	--	--	--
		PM	--	--	--	--	--	--	--	--	--	--
9. Brea Plaza Driveway 4 at Imperial Highway	D	AM	--	--	--	--	--	--	--	--	--	--
		PM	--	--	--	--	--	--	--	--	--	--

Notes:

- **Bold ICU/LOS** values indicate adverse service levels based on the City LOS standards.

8.2 Year 2024 Traffic Conditions - HCM

Table 8-2 summarizes the peak hour Level of Service results at the nine (9) study intersections evaluated under HCM analysis for the Year 2024 horizon year. The first column (1) of HCM/LOS values in *Table 8-2* presents a summary of existing peak hour traffic conditions. The second column (2) lists projected cumulative traffic conditions (existing plus ambient plus related projects traffic) based on existing intersection geometry, but without any traffic generated from the proposed Project. The third column (3) presents forecast Year 2024 near-term traffic conditions with the addition of Project traffic. The fourth column (4) shows the increase in delay due to the added peak hour Project trips and indicates whether the traffic associated with the proposed Project will exceed the LOS thresholds defined in this report. The fifth column (5) presents the resultant level of service with the inclusion of recommended traffic improvements, where needed, to achieve an acceptable level of service.

8.2.1 *Year 2024 Cumulative Traffic Conditions - HCM*

Review of column (2) of *Table 8-2* indicates that one (1) intersection is forecast to operate adversely during the AM and/or PM peak hours under Year 2024 cumulative traffic conditions. The remaining study intersections are forecast to operate at acceptable LOS D or better during the weekday AM and PM peak hours. The intersection operating adversely includes the following:

	AM Peak Hour		PM Peak Hour	
Study Intersection	**Delay (s/v)**	**LOS**	**Delay (s/v)**	**LOS**
9. Brea Plaza Driveway 4 at Imperial Highway	--	--	35.8	E

8.2.2 *Year 2024 Cumulative Plus Project Conditions - HCM*

Review of columns (3) and (4) of *Table 8-2* indicates that all of the study intersections are forecast to operate at acceptable LOS D or better during the weekday AM and PM peak hours with the addition proposed Project traffic to Year 2024 cumulative traffic.

Although the intersection of Brea Plaza Driveway 4/Imperial Highway (Intersection #9) was operating adversely under Year 2024 cumulative traffic conditions, review of column (4) of *Table 8-2* indicates that the addition of the proposed Project traffic results in a reduction in delay in the PM peak hour. The reduction in delay is due to the negative net project volumes during the PM peak hour.

Appendix D presents the HCM LOS calculation worksheets for the study intersections.

TABLE 8-2

YEAR 2024 PEAK HOUR INTERSECTION CAPACITY ANALYSIS - HCM

Study Intersection	Minimum Acceptable LOS	Time Period	(1) Existing Traffic Conditions		(2) Year 2024 Cumulative Traffic Conditions		(3) Year 2024 Cumulative Plus Project Traffic Conditions		(4) Exceed LOS Thresholds		(5) Year 2024 Cumulative Plus Project Plus Improvements Traffic Conditions

		PM	30.9	D	**35.8**	**E**	35.0	D	-0.8[24]	No	--	--

Notes:

- s/v = seconds per vehicle
- **Bold HCM/LOS** values indicate adverse service levels based on the City LOS standards.

[24] A reduction in delay is due to the shifting of volumes going to/from the Mercury Insurance site under Project conditions. Currently, cross-access between Mercury Insurance and Brea Plaza is currently allowed, however, the easement with Mercury Insurance will no longer be applicable as part of the proposed Project. Employees/patrons of Mercury Insurance will be expected to utilize Greenbriar Road to access their site rather than cutting through Brea Plaza. The reduction in delay is also due to the negative net project volumes during the PM peak hour only.

8.3 Year 2045 General Plan Buildout Traffic Conditions - ICU

Table 8-3 summarizes the peak hour Level of Service results at the six (6) signalized study intersections evaluated under ICU analysis for the Year 2045. The first column (1) of ICU/LOS values in *Table 8-3* presents a summary of existing peak hour traffic conditions. The second column (2) lists projected Year 2045 General Plan Buildout traffic conditions based on existing intersection geometry, but without any traffic generated from the proposed Project. The third column (3) presents forecast Year 2045 General Plan Buildout traffic conditions with the addition of Project traffic. The fourth column (4) shows the increase in ICU value due to the added peak hour Project trips and indicates whether the traffic associated with the proposed Project will exceed the LOS thresholds defined in this report. The fifth column (5) presents the resultant level of service with the inclusion of recommended traffic improvements, where needed, to achieve an acceptable level of service.

8.3.1 *Year 2045 General Plan Buildout Traffic Conditions - ICU*

Review of column (2) of *Table 8-3* indicates that all of the signalized study intersections are forecast to operate at acceptable LOS D or better during the weekday AM and PM peak hours under Year 2045 General Plan Buildout traffic conditions.

8.3.2 *Year 2045 General Plan Buildout Plus Project Traffic Conditions - ICU*

Review of columns (3) and (4) of *Table 8-3* indicates that all of the signalized study intersections are forecast to operate at acceptable LOS D or better during the weekday AM and PM peak hours with the addition of proposed Project traffic to Year 2045 General Plan Buildout traffic.

Appendix C presents the ICU LOS calculation worksheets for the study intersections.

TABLE 8-3

YEAR 2045 PEAK HOUR INTERSECTION CAPACITY ANALYSIS - ICU

Study Intersection	Minimum Acceptable LOS	Time Period	(1) Existing Traffic Conditions		(2) Year 2045 General Plan Buildout Traffic Conditions		(3) Year 2045 General Plan Buildout Plus Project Traffic Conditions		(4) Exceed LOS Thresholds		(5) Year 2045 General Plan Buildout Plus Project Plus Improvements Traffic Conditions	
			ICU	LOS	ICU	LOS	ICU	LOS	Increase	Yes/No	ICU	LOS

		PM	0.684	B	0.749	C	0.749	C	0.000	No	--	--
7. S. Associated Road at Brea Plaza Driveway 2	D	AM	--	--	--	--	--	--	--	--	--	--
		PM	--	--	--	--	--	--	--	--	--	--

Notes:

- **Bold ICU/LOS** values indicate adverse service levels based on the City LOS standards.

[25] A reduction in delay is due to the negative net project volumes during the PM peak hour only.

[26] A reduction in delay is due to the shifting of volumes going to/from the Mercury Insurance site under Project conditions. Currently, cross-access between Mercury Insurance and Brea Plaza is currently allowed, however, the easement with Mercury Insurance will no longer be applicable as part of the proposed Project. Employees/patrons of Mercury Insurance will be expected to utilize Greenbriar Road to access their site rather than cutting through Brea Plaza. The reduction in delay is also due to the negative net project volumes during the PM peak hour only.

TABLE 8-3 (CONTINUED)

YEAR 2045 PEAK HOUR INTERSECTION CAPACITY ANALYSIS - ICU

Study Intersection	Minimum Acceptable LOS	Time Period	(1) Existing Traffic Conditions		(2) Year 2045 General Plan Buildout Traffic Conditions		(3) Year 2045 General Plan Buildout Plus Project Traffic Conditions		(4) Exceed LOS Thresholds		(5) Year 2045 General Plan Buildout Plus Project Plus Improvements Traffic Conditions	
			ICU	LOS	ICU	LOS	ICU	LOS	Increase	Yes/No	ICU	LOS
8. S. Associated Road at Brea Plaza Driveway 3	D	AM	--	--	--	--	--	--	--	--	--	--
		PM	--	--	--	--	--	--	--	--	--	--
9. Brea Plaza Driveway 4 at Imperial Highway	D	AM	--	--	--	--	--	--	--	--	--	--
		PM	--	--	--	--	--	--	--	--	--	--

Notes:

- **Bold ICU/LOS** values indicate adverse service levels based on the City LOS standards.

8.4 Year 2045 General Plan Buildout Traffic Conditions - HCM

Table 8-4 summarizes the peak hour Level of Service results at the nine (9) study intersections evaluated under HCM analysis for the Year 2045. The first column (1) of HCM/LOS values in *Table 8-4* presents a summary of existing peak hour traffic conditions. The second column (2) lists projected Year 2045 General Plan Buildout traffic conditions based on existing intersection geometry, but without any traffic generated from the proposed Project. The third column (3) presents forecast Year 2045 General Plan Buildout traffic conditions with the addition of Project traffic. The fourth column (4) shows the increase in delay due to the added peak hour Project trips and indicates whether the traffic associated with the proposed Project will exceed the LOS thresholds defined in this report. The fifth column (5) presents the resultant level of service with the inclusion of recommended traffic improvements, where needed, to achieve an acceptable level of service.

8.4.1 *Year 2045 General Plan Buildout Traffic Conditions - HCM*

Review of column (2) of *Table 8-4* indicates that one (1) intersection is forecast to operate adversely during the AM and/or PM peak hours under Year 2045 General Plan Buildout traffic conditions. The remaining study intersections are forecast to operate at acceptable LOS D or better during the weekday AM and PM peak hours. The intersection operating adversely includes the following:

	AM Peak Hour		PM Peak Hour	
Study Intersection	**Delay (s/v)**	**LOS**	**Delay (s/v)**	**LOS**
9. Brea Plaza Driveway 4 at Imperial Highway	--	--	39.6	E

8.4.2 *Year 2045 General Plan Buildout Plus Project Traffic Conditions – HCM*

Review of column (3) of *Table 8-4* indicates that one (1) intersection is forecast to operate adversely during the AM and/or PM peak hours with the addition of proposed Project traffic to Year 2045 General Plan Buildout traffic. The remaining study intersections are forecast to operate at acceptable LOS D or better during the weekday AM and PM peak hours. The intersection operating adversely includes the following:

	AM Peak Hour		PM Peak Hour	
Study Intersection	**Delay (s/v)**	**LOS**	**Delay (s/v)**	**LOS**
9. Brea Plaza Driveway 4 at Imperial Highway	--	--	38.8	E

Review of column (4) of *Table 8-4* indicates that the addition of proposed Project traffic at the intersection of Brea Plaza Driveway 4/Imperial Highway (Intersection #9) results in a reduction in delay in the PM peak hour. The reduction in delay is due to the negative net project volumes during the PM peak hour. Therefore, Project-related improvements at this location are not required based on the criteria defined in this report.

Appendix D presents the HCM LOS calculation worksheets for the study intersections.

TABLE 8-4

		PM	30.9	D	**39.6**	**E**	**38.8**	**E**	-0.8[29]	No	--	--

Notes:

- s/v = seconds per vehicle
- **Bold HCM/LOS** values indicate adverse service levels based on the City LOS standards.

[29] A reduction in delay is due to the negative net project volumes during the PM peak hour only.

9.0 INTERSECTION VEHICLE QUEUEING EVALUATION

A queueing evaluation has been completed at the nine (9) study intersections to assess if the stacking requirements with the proposed Project are adequate. In addition, it is our understanding that Caltrans has concerns regarding safety and queuing issues due to weaving along Imperial Highway at the SR-57 NB On-Ramp, located approximately 150 feet from the Brea Plaza Driveway 1.

The queuing evaluation was conducted for Year 2024 Cumulative and Year 2045 General Plan Buildout traffic conditions based on the Average Queue methodology, which calculates the average queue value in terms of number of vehicles per lane. At signalized intersections, the storage length for left-turn and right-turn lanes may be based on one and one-half (1½) to two (2) times the average number of vehicles that would store per signal cycle[30]. For the purposes of this traffic analysis, the minimum storage requirement for left-turn lanes and right-turn lanes was calculated by taking 1½ times the average queue length. (Minimum required storage = Q_{av} (feet) x 1.5). The storage lengths at unsignalized intersection locations are based on 95th Percentile methodology.

It should be noted that the Synchro software takes into consideration traffic volume data, lane configurations, traffic signal phasing and potential weaving between intersections in order to calculate the queues for each movement. The existing storage lengths were determined based on a review of aerial maps of the subject intersections obtained from Google Earth and field reviews conducted by LLG Engineers. An average vehicle length of 25 feet is assumed for the purposes of this analysis.

9.1 Year 2024 Traffic Conditions

Table 9-1 presents the AM and PM peak hour queueing analyses results for the nine (9) study intersections. Column (1) presents the queueing results for Year 2024 Cumulative traffic conditions. Column (2) presents the queueing results for Year 2024 Cumulative Plus Project traffic conditions.

9.1.1 *Year 2024 Cumulative Traffic Conditions*

Review of column (1) of *Table 9-1* indicates that the queues for the nine (9) study intersections are considered adequate under Year 2024 Cumulative traffic conditions.

9.1.2 *Year 2024 Cumulative Plus Project Traffic Conditions*

Review of column (2) of *Table 9-1* indicates that the queues for the nine (9) study intersections are considered adequate with the addition of project traffic to Year 2024 Cumulative traffic. Furthermore, review of SR-57 NB Ramps/Brea Plaza Driveway 1/Imperial Highway (Intersection #2) indicates that the proposed Project will not adversely affect the queues at the intersection or adversely contribute to the potential weaving along Imperial Highway between the SR-57 NB On-Ramp and Brea Plaza Driveway 1.

Appendix F presents the Synchro queuing worksheets for the study intersections.

9.2 Year 2045 General Plan Buildout Traffic Conditions

Table 9-2 presents the AM and PM peak hour queueing analyses results for the nine (9) study intersections. Column (1) presents the queueing results for Year 2045 General Plan Buildout traffic conditions. Column (2) presents the queueing results for Year 2045 General Plan Buildout Plus Project traffic conditions.

9.2.1 *Year 2045 General Plan Buildout Traffic Conditions*

Review of column (1) of *Table 9-2* indicates that the queues for the nine (9) study intersections are considered adequate under Year 2045 General Plan Buildout traffic conditions.

9.2.2 *Year 2045 General Plan Buildout Plus Project Traffic Conditions*

Review of column (2) of *Table 9-2* indicates that the queues for the nine (9) study intersections are considered adequate with the addition of project traffic to Year 2045 General Plan Buildout traffic. Furthermore, review of SR-57 NB Ramps/Brea Plaza Driveway 1/Imperial Highway (Intersection #2) indicates that the proposed Project will not adversely affect the queues at the intersection or adversely contribute to the potential weaving along Imperial Highway between the SR-57 NB On-Ramp and Brea Plaza Driveway 1.

Appendix F presents the Synchro queuing worksheets for the study intersections.

31 Maximum queue is calculated by multiplying the *Average Queue* by a factor of 1.5 for signalized intersections. Maximum queue is based on the 95th percentile for unsignalized intersections.

32 The southbound right-turn pocket consists of approximately 265 feet of storage; however, an additional 1,035 feet of storage from the shared left/right-turn lane can accommodate the remaining vehicles.

33 The northbound left-turn consists of dual lanes. The first lane consists of approximately 1,300 feet of storage and the second lane consists of approximately 610 feet of storage. The storage reported is the average of both lanes.

34 The northbound right-turn pocket consists of approximately 500 feet or storage; however, an additional 800 feet of storage from the shared left/thru/right lane can accommodate the remaining vehicles.

35 The turn-lane consists of dual lanes.

10.0 INTERSECTION SAFETY EVALUATION

10.1 Imperial Highway Intersection Safety Evaluation

It is our understanding that Caltrans has implemented improvements at intersections along Imperial Highway within the recent years which generally include traffic signal upgrades and ADA improvements. As such, an intersection safety evaluation has been completed for all of the signalized study intersections located along Imperial Highway to validate whether the recent improvements have helped reduce the collision frequency at these locations.

Five years of collision history has been researched via the Statewide Integrated Traffic Records System (SWITRS); the data was compiled from May 2016 through May 2021. ***Table 10-1*** presents a summary of the last five (5) years of accident history at the four (4) study intersections located along Imperial Highway. Review of *Table 10-1* indicates that when taking into consideration the total number of collisions that occur within the project study area, the number of collisions along Imperial Highway have generally declined within the last five years. Therefore, it can be concluded that the improvements implemented at these intersections have played a role in reducing the collision frequency and has generally helped increase safety at the locations.

10.2 Intersection Safety Enhancements at S. Associated Road and Birch Street

The City has raised concerns regarding bicycle safety at the intersection of S. Associated Road at Birch Street. It is our understanding that the eastbound right-turn movement at the intersection currently experiences high traffic volumes due to the existing Brea Plaza center. Review of *Figures 3-5* and *3-6* indicate that 294 vehicles in the AM peak hour and 278 vehicles in the PM peak hour currently complete an eastbound right-turn under existing traffic conditions. Vehicles are required to cross the existing bike lane in order to complete the turn movement which creates a safety issue for bicyclists traveling eastbound. Therefore, to increase bicycle safety as well as improve traffic flow, it is recommended to implement the following improvements:

- **Intersection No. 3 – S. Associated Road at Birch Street:** Restripe the west leg to provide an exclusive eastbound right-turn pocket with 150-feet of storage and a 4-foot bike lane located to the left of the turn pocket. Modify the existing traffic signal to allow for an eastbound right-turn overlap phase and replace the existing R73-5(CA) sign for the northbound left-turn lanes with a R73-6(CA) sign to restrict U-turns in the northbound direction. These improvements are subject to the approval of the City of Brea and are recommended as a condition of approval for the proposed Project.

Figure 10-1 presents a conceptual improvement plan for the intersection safety enhancements at S. Associated Road and Birch Street.

Table 10-2 presents the peak hour level of service results based on both ICU and HCM analyses at the intersection of S. Associated Road at Birch Street for Year 2045 traffic conditions. The first

column (1) presents a summary of Year 2045 General Plan Buildout Plus Project traffic conditions, which was previously presented in *Tables 8-3* and *8-4*. The second column (2) presents Year 2045 General Plan Buildout Plus Project traffic conditions with the implementation of the intersection safety enhancement improvements. Review of *Table 10-2* indicates that the intersection is forecast to operate at acceptable level of service during the weekday AM and PM peak hours with the improvements. Furthermore, a comparison of columns (1) and (2) indicate that the improvements will improve service levels at the intersection.

Table 10-3 presents the AM and PM peak hour queueing analyses results for the eastbound right-turn pocket for Year 2045 General Plan Buildout Plus Project traffic conditions with the implementation of the intersection safety enhancement improvements. Review of *Table 10-3* indicates that the eastbound right-turn queues at the intersection can be accommodated within the proposed storage of 150 feet.

Appendix G presents the level of service and queueing worksheets based on the intersection safety enhancement.

[59] Maximum queue is calculated by multiplying the *Average Queue* by a factor of 1.5 for signalized intersections. Maximum queue is based on the 95th percentile for unsignalized intersections.

11.0 SITE ACCESS EVALUATION

11.1 Driveway 3 Traffic Signal Warrant Analysis

Due to the expiration of the Mercury Insurance easement, motorists leaving the project site who wish to travel north will no longer have access to Greenbriar Lane and are anticipated to primarily utilize Driveway 3. As such, a traffic signal warrant analysis was completed for S. Associated Road at Brea Plaza Driveway 3 to determine the need for signalization at the intersection.

This assessment is made on the basis of signal warrant criteria adopted by Caltrans. For this study, the need for signalization is assessed on the basis of the peak-hour traffic signal warrant, Warrant #3, described in the *California Manual on Uniform Traffic Control Devices (MUTCD).*

Warrant #3 has two parts:

1. *Part A* evaluates peak hour vehicle delay for traffic on the minor street approach with the highest delay, and
2. *Part B* evaluates peak-hour traffic volumes on the major and minor streets.

This method provides an indication of whether peak-hour traffic conditions or peak-hour traffic volume levels are, or would be, sufficient to justify installation of a traffic signal. Other traffic signal warrants are available, however, they cannot be checked under future conditions because they rely on data for which forecasts are not available (such as accidents, pedestrian volume, and four- or eight-hour vehicle volumes).

The decision to install a traffic signal should not be based purely on the warrants alone. Instead, the installation of a signal should be considered and further analysis performed when one or more of the warrants are met. Additionally, engineering judgment is exercised on a case-by-case basis to evaluate the effect a traffic signal will have on certain types of accidents and traffic conditions at the subject intersection as well as at adjacent intersections.

The results of the peak-hour traffic signal warrant analysis for Year 2024 Cumulative Plus Project and Year 2045 General Plan Buildout Plus Project traffic conditions are summarized in ***Table 11-1***. The results indicate that S. Associated Road at Brea Plaza Driveway 3 does not satisfy the criteria for a traffic signal. Furthermore, review of the level of service results presented in Section 8.0 indicates that the intersection is forecast to operate at acceptable level of service without the installation of a traffic signal. Therefore, the installation of a traffic signal the intersection is not recommended.

Appendix H presents the traffic signal warrant worksheets.

TABLE 11-1

DRIVEWAY 3 TRAFFIC SIGNAL WARRANT ANALYSIS SUMMARY[60]

Key Intersection	Time Period	(1) Year 2024 Cumulative Plus Project Traffic Conditions		(2) Year 2045 General Plan Buildout Plus Project Traffic Conditions	
		Part A of Warrant 3 Satisfied?	Part B of Warrant 3 Satisfied?	Part A of Warrant 3 Satisfied?	Part B of Warrant 3 Satisfied?
8. S. Associated Road at Brea Plaza Driveway 3	AM	No	No	No	No
	PM	No	No	No	No

60 Signal Warrant checks based on Warrant 3, Part A – Peak Hour Delay Warrant and Part B – Peak Hour Volume Warrant combined in the California MUTCD.

11.2 Internal Circulation Evaluation

As previously stated, access to the project site will continue to be served by the existing Brea Plaza driveways including the signalized intersection of Imperial Highway at SR-57 NB Ramps/Brea Plaza (Intersection #2), a right-turn only driveway on Associated Road (Intersection #7), a full access unsignalized driveway on Associated Road (Intersection #8), and a right-turn only driveway on Imperial Highway (Intersection #9). Since there are no changes proposed at any of the driveways as part of the proposed Project, it is assumed that trash trucks, delivery trucks, and fire trucks will continue to access the Project site without any issues. Additionally, the on-site circulation was evaluated in terms of vehicle-pedestrian conflicts. Based on our review of the proposed site plan, the overall layout does not create any unsafe vehicle-pedestrian conflict points and the driveway throating is sufficient such that access to parking spaces is not impacted by internal vehicle queuing/stacking. The on-site circulation is adequate based on our review of the proposed site plan, whereas the alignment, spacing, and throating of the Project driveways is adequate. The circulation around the buildings is adequate with sufficient sight distance along the drive aisles.

12.0 AREA-WIDE TRAFFIC IMPROVEMENTS

For those intersections where projected traffic volumes are expected to exceed the LOS criteria thresholds, this report recommends traffic improvements that change the intersection geometry to increase capacity. These capacity improvements involve roadway widening and/or re-striping to reconfigure roadways to specific approaches of a study intersection. The identified improvements are expected to improve levels of service at the location which exceed the LOS criteria thresholds.

12.1 Project-Specific Improvements

As previously discussed in Section 10.2, the following improvements are recommended as a condition of approval for the proposed Project in order to increase bicycle safety as well as improve traffic flow at the intersection of S. Associated Road at Birch Street:

- **Intersection No. 3 – S. Associated Road at Birch Street:** Restripe the west leg to provide an exclusive eastbound right-turn pocket with 150-feet of storage and a 4-foot bike lane located to the left of the turn pocket. Modify the existing traffic signal to allow for an eastbound right-turn overlap phase and replace the existing R73-5(CA) sign for the northbound left-turn lanes with a R73-6(CA) sign to restrict U-turns in the northbound direction. These improvements are subject to the approval of the City of Brea.

12.2 Year 2024 Cumulative Plus Project Traffic Conditions

The results of the intersection capacity analyses presented previously in *Tables 8-1* and *8-2* indicate that none of the nine (9) study intersections are forecast to exceed the LOS criteria thresholds under Year 2024 Cumulative Plus Project traffic conditions. Therefore, Project-related improvements are not required or recommended.

12.3 Year 2045 General Plan Buildout Plus Project Traffic Conditions

The results of the intersection capacity analyses presented previously in *Tables 8-3* and *8-4* indicate that none of the nine (9) study intersections are forecast to exceed the LOS criteria thresholds under Year 2045 General Plan Buildout Plus Project traffic conditions. Therefore, Project-related improvements are not required or recommended.

12.4 City of Brea Traffic Impact Fees

Based on information published on the City of Brea website, the Brea City Council adopted Ordinance 966 in July 1995, establishing Traffic Impact Fees for all new development in Brea and annexed portions of its sphere-of-influence. Based on a Transportation Improvement Nexus Program study conducted in 2011, the City Council adopted Resolution 2011-096, which updated the impact fees, which became effective February 4, 2012. These fees are required, in part, by Orange County's Measure M, a transportation initiative passed by voters in 1990. More importantly, these are fair-share based fees that will serve to offset the required traffic improvements caused by new development.

Review of ***Table 12-1*** indicates that the City's Traffic Impact Fee rate for residential land uses range from $1,203 per dwelling unit to $1,974 per dwelling unit. For Office uses the City's rate is $1.25 per gross square foot.

Subject to confirmation by City staff, the proposed Project's Traffic Impact Fee totals $260,852.75 based on a net increase of 21,355 SF of office uses along with 229 high density residential units (i.e. 21,355 SF x $1.25 per SF = $26,693.75 and 229 DU x $1,203 per DU = $275,487.00). Since fees have already been paid towards the existing theater which will be removed a credit of $41,328.00 could be taken (i.e. 18,450 SF x $2.24 = $41,328.00). The precise fee will be determined upon issuance of Project building permits by the City of Brea Community Development Department.

TABLE 12-1

CITY OF BREA TRAFFIC IMPACT FEE RATES [61]

Land Use Category	Unit of Development	Fee
▪ Low density residential	Per dwelling unit	$1,974
▪ Medium density residential	Per dwelling unit	$1,453
▪ High density residential	Per dwelling unit	$1,203
▪ Commercial, general, mixed use	Per gross square foot	$2.53
▪ Regional commercial	Per gross square foot	$2.24
▪ Office / industrial	Per gross square foot	$1.25
▪ School	Student	$0
▪ All other uses	Per trip end	$89

61 Source: City of Brea website - http://www.ci.brea.ca.us/162/Traffic-Impact-Fees

13.0 CONGESTION MANAGEMENT PROGRAM (CMP) COMPLIANCE ASSESSMENT

This analysis is consistent with the requirements and procedures outlined in the current *Orange County Congestion Management Program (CMP).* The CMP requires that a traffic analysis be conducted for any project generating 2,400 or more daily trips, or 1,600 or more daily trips for projects that directly access the CMP Highway System (HS). As noted in *Section 5.0* of this traffic study, the proposed Project is forecast to generate -1,680 weekday net daily trip-ends and therefore a CMP analysis is not required.

14.0 SUMMARY OF FINDINGS AND CONCLUSIONS

- ***Project Description*** – Brea Plaza is an existing retail center addressed at 409-477 S. Associated Road and 1555, 1609, 1623, 1643 E. Imperial Highway that is generally located north of Imperial Highway, west of Associated Road, and east of SR-57 Freeway in the City of Brea, California. The existing Brea Plaza includes 165,329 square-feet (SF) of floor area consisting of mixture of retail/commercial use, service/retail shops, a movie theatre, restaurant/ food uses and fast-food restaurants with drive-through. Parking for the retail center currently totals 725 on-site spaces with an additional 180 spaces available in an easement with Mercury Insurance during business hours and all spaces after 5:00 PM and on weekends. It is our understanding that the easement with Mercury Insurance will expire upon completion of the proposed Project, therefore, all of the project parking demands will be accommodated on-site. The proposed Project includes a mixed-use development that consists of 21,355 SF of office space and 189 apartment units. Fifteen (15) of the proposed apartments are considered co-living units, which include five (5) 3-bedroom units and ten (10) four-bedroom units, therefore, to provide a conservative assessment, the co-living unit bedrooms have been counted as individual units for a total apartment count of 229 units. The proposed Project also includes a 387-space and 10 tandem stall parking structure on the northwest quadrant of the subject property. The implementation of the proposed Project would require the demolition of the existing 18,450 SF movie theatre (Brea Plaza 5 Cinemas) and result in the overall loss of 116 surface parking spaces.

  Vehicular access to Brea Plaza is currently provided via one (1) right-turn only and one (1) full access unsignalized driveways on Associated Road, and a right-turn only driveway on Imperial Highway, and the signalized intersection of Imperial Highway at SR-57 NB Ramps/Brea Plaza. No change in access to Brea Plaza is proposed as a part of the Project. Further, with the exception of the parking and circulation layout on the northwest corner of the site where the proposed Project will be constructed, no changes to the internal circulation and primary parking layout in the center and southern portion of the site will change. To maintain circulation around the entire property, the Project does propose to maintain/construct a "Fire Lane" along the northern and western edge of the Project thereby providing emergency vehicle as well as Project-related traffic the ability to circulate the entire site to access either Associated Road or Imperial Highway.

- ***Study Scope*** – Nine (9) study intersections have been identified for evaluation in collaboration with City of Brea staff. The nine (9) intersections listed below provide regional and local access to the study area and define the extent of the boundaries for this traffic analysis, as well as identifies the governing jurisdiction. It should be noted that intersections that border Brea but are under the governing jurisdiction of Caltrans show the City in parentheses [i.e. (Brea)].

  Study Intersections – Jurisdiction (City)

  1. SR-57 SB Ramps at Imperial Highway - Caltrans (Brea)
  2. SR-57 NB Ramps/Brea Plaza Driveway 1 at Imperial Highway -Caltrans (Brea)
  3. S. Associated Road at Birch Street - Brea
  4. S. Associated Road at Greenbriar Lane - Brea

5. S. Associated Road at Imperial Highway – Caltrans (Brea)
6. Castlegate Lane/Placentia Avenue at Imperial Highway – Caltrans (Brea)
7. S. Associated Road at Brea Plaza Driveway 2 - Brea
8. S. Associated Road at Brea Plaza Driveway 3 - Brea
9. Brea Plaza Driveway 4 at Imperial Highway – Caltrans (Brea)

- ***Existing Traffic Conditions ICU*** – All of the signalized study intersections currently operate at acceptable service levels during the weekday AM and PM peak hours.

- ***Existing Traffic Conditions HCM*** – All of the study intersections currently operate at acceptable service levels during the weekday AM and PM peak hours.

- ***Project Trip Generation*** – A fully occupied Brea Plaza is forecast to generate approximately 8,963 daily trips, with 202 trips (126 inbound, 76 outbound) produced in the AM peak hour and 576 trips (283 inbound, 293 outbound) produced in the PM peak hour on a "typical" weekday, and 12,644 daily trips with 1,261 trips (646 inbound, 615 outbound) produced in the Midday peak hour on a "typical" Saturday.

  The trip generation associated with Brea Plaza upon implementation of the proposed Project is forecast to generate approximately 7,283 daily trips, with 302 trips (165 inbound, 137 outbound) produced in the AM peak hour and 516 trips (250 inbound, 266 outbound) produced in the PM peak hour on a "typical" weekday, and 10,362 daily trips with 772 trips (370 inbound, 402 outbound) produced in the Midday peak hour on a "typical" Saturday.

  When the existing Brea Plaza is compared to the retail center with the proposed Project, the implementation of the proposed Project is forecast result in 1,680 *fewer* weekday daily trips, 100 *more* weekday AM peak hour trips, and 60 *fewer* weekday PM peak hour trips, as well as 2,282 *fewer* Saturday daily trips, and 489 *fewer* Saturday midday peak hour trips. As a result, a Saturday analysis is not recommended. Therefore, this traffic analysis will be based on the net AM peak hour and PM peak hour project trips.

- ***Related Projects Traffic Characteristics –*** Fourteen (14) related projects were considered as part of the cumulative background setting. The fourteen (14) related projects on a weekday daily and peak hour basis. As shown, the related projects are expected to generate 35,920 weekday daily trips, with 2,713 trips (1,312 inbound, 1,401 outbound) anticipated during the AM peak hour and 3,274 trips (1,709 inbound, 1,565 outbound) produced during the PM peak hour.

- ***Year 2024 Cumulative Traffic Conditions Plus Project ICU*** – All of the signalized study intersections are forecast to operate at acceptable LOS D or better during the weekday AM and PM peak hours with the addition of proposed Project traffic to Year 2024 cumulative traffic.

- ***Year 2024 Cumulative Traffic Conditions Plus Project HCM*** – All of the study intersections are forecast to operate at acceptable LOS D or better during the weekday AM and PM peak hours with the addition proposed Project traffic to Year 2024 cumulative traffic.

Although the intersection of Brea Plaza Driveway 4/Imperial Highway (Intersection #9) was operating adversely under Year 2024 cumulative traffic conditions, the addition of the proposed Project traffic results in a reduction in delay in the PM peak hour. The reduction in delay is due to the negative net project volumes during the PM peak hour.

- ***Year 2045 General Plan Buildout Traffic Conditions Plus Project ICU*** – All of the signalized study intersections are forecast to operate at acceptable LOS D or better during the weekday AM and PM peak hours with the addition of proposed Project traffic to Year 2045 General Plan Buildout traffic.

- ***Year 2045 General Plan Buildout Traffic Conditions Plus Project HCM*** – One (1) intersection is forecast to operate adversely during the AM and/or PM peak hours with the addition of proposed Project traffic to Year 2045 General Plan Buildout traffic. The remaining study intersections are forecast to operate at acceptable LOS D or better during the weekday AM and PM peak hours. The intersection operating adversely includes the following:

	AM Peak Hour		PM Peak Hour	
Study Intersection	**Delay (s/v)**	**LOS**	**Delay (s/v)**	**LOS**
9. Brea Plaza Driveway 4 at Imperial Highway	--	--	38.8	E

The addition of proposed Project traffic at the intersection of Brea Plaza Driveway 4/Imperial Highway (Intersection #9) results in a reduction in delay in the PM peak hour. The reduction in delay is due to the negative net project volumes during the PM peak hour. Therefore, Project-related improvements at this location are not required based on the criteria defined in this report.

- ***Year 2024 Cumulative Traffic Conditions Plus Project Queueing*** – The queues for the nine (9) study intersections are considered adequate with the addition of proposed project traffic to Year 2024 Cumulative traffic. Furthermore, review of SR-57 NB Ramps/Brea Plaza Driveway 1/Imperial Highway (Intersection #2) indicates that the proposed Project will not adversely affect the queues at the intersection or adversely contribute to the potential weaving along Imperial Highway between the SR-57 NB On-Ramp and Brea Plaza Driveway 1.

- ***Year 2045 General Plan Buildout Traffic Conditions Plus Project Queueing*** – The queues for the nine (9) study intersections are considered adequate with the addition of proposed project traffic to Year 2045 General Plan Buildout traffic. Furthermore, review of SR-57 NB Ramps/Brea Plaza Driveway 1/Imperial Highway (Intersection #2) indicates that the proposed Project will not adversely affect the queues at the intersection or adversely contribute to the potential weaving along Imperial Highway between the SR-57 NB On-Ramp and Brea Plaza Driveway 1.

- ***Imperial Highway Intersection Safety Evaluation*** – It is our understanding that Caltrans has implemented improvements at intersections along Imperial Highway within the recent years which generally include traffic signal upgrades and ADA improvements. Five years of collision history has been researched via the Statewide Integrated Traffic Records System (SWITRS); the data was compiled from May 2016 through May 2021. When taking into consideration the total

number of collisions that occur within the project study area, the number of collisions along Imperial Highway have generally declined within the last five years. Therefore, it can be concluded that the improvements implemented at these intersections have played a role in reducing the collision frequency and has generally helped increase safety at the locations

- ***Intersection Safety Enhancements at S. Associated Road at Birch Street*** – The City has raised concerns regarding bicycle safety at the intersection of S. Associated Road at Birch Street. It is our understanding that the eastbound right-turn movement at the intersection currently experiences high traffic volumes due to the existing Brea Plaza center. Vehicles are required to cross the existing bike lane in order to complete the turn movement which creates a safety issue for bicyclists traveling eastbound. Therefore, to increase bicycle safety as well as improve traffic flow, it is recommended to implement the following improvements:

  - Intersection No. 3 – S. Associated Road at Birch Street: Restripe the west leg to provide an exclusive eastbound right-turn pocket with 150-feet of storage and a 4-foot bike lane located to the left of the turn pocket. Modify the existing traffic signal to allow for an eastbound right-turn overlap phase and replace the existing R73-5(CA) sign for the northbound left-turn lanes with a R73-6(CA) sign to restrict U-turns in the northbound direction. These improvements are subject to the approval of the City of Brea and are recommended as a condition of approval for the proposed Project.

  The intersection is forecast to operate at acceptable level of service during the weekday AM and PM peak hours with the improvements and will also improve service levels at the intersection. Additionally, the eastbound right-turn queues at the intersection can be accommodated within the proposed storage of 150 feet.

- ***Driveway 3 Traffic Signal Warrant Analysis –*** S. Associated Road at Brea Plaza Driveway 3 does not satisfy the criteria for a traffic signal. Furthermore, review of the level of service results indicates that the intersection is forecast to operate at acceptable level of service without the installation of a traffic signal. Therefore, the installation of a traffic signal the intersection is not recommended.

- ***Internal Circulation Evaluation –*** Access to the project site will continue to be served by the existing Brea Plaza driveways including the signalized intersection of Imperial Highway at SR-57 NB Ramps/Brea Plaza (Intersection #2), a right-turn only driveway on Associated Road (Intersection #7), a full access unsignalized driveway on Associated Road (Intersection #8), and a right-turn only driveway on Imperial Highway (Intersection #9). Since there are no changes proposed at any of the driveways as part of the proposed Project, it is assumed that trash trucks, delivery trucks, and fire trucks will continue to access the Project site without any issues. Additionally, based on our review of the proposed site plan, the overall layout does not create any unsafe vehicle-pedestrian conflict points and the driveway throating is sufficient such that access to parking spaces is not impacted by internal vehicle queuing/stacking. The on-site circulation is adequate based on our review of the proposed site plan, whereas the alignment, spacing, and throating of the Project driveways is adequate. The circulation around the buildings is adequate with sufficient sight distance along the drive aisles.

- ***Project-Specific Improvements*** – The following improvements are recommended as a condition of approval for the proposed Project in order to increase bicycle safety as well as improve traffic flow at the intersection of S. Associated Road at Birch Street:

  - Intersection No. 3 – S. Associated Road at Birch Street: Restripe the west leg to provide an exclusive eastbound right-turn pocket with 150-feet of storage and a 4-foot bike lane located to the left of the turn pocket. Modify the existing traffic signal to allow for an eastbound right-turn overlap phase and replace the existing R73-5(CA) sign for the northbound left-turn lanes with a R73-6(CA) sign to restrict U-turns in the northbound direction. These improvements are subject to the approval of the City of Brea and are recommended as a condition of approval for the proposed Project.

- ***Year 2024 Cumulative Plus Project Recommended Improvements*** – None of the nine (9) study intersections are forecast to exceed the LOS criteria thresholds under Year 2024 Cumulative Plus Project traffic conditions. Therefore, Project-related improvements are not required or recommended.
- ***Year 2045 General Plan Buildout Plus Project Recommended Improvements*** – None of the nine (9) study intersections are forecast to exceed the LOS criteria thresholds under Year 2045 General Plan Buildout Plus Project traffic conditions. Therefore, Project-related improvements are not required or recommended.
- ***Traffic Impact Fees*** – Subject to confirmation by City staff, the proposed Project's Traffic Impact Fee totals $260,852.75 based on a net increase of 21,355 SF of office uses along with 229 high density residential units (i.e. 21,355 SF x $1.25 per SF = $26,693.75 and 229 DU x $1,203 per DU = $275,487.00). Since fees have already been paid towards the existing theater which will be removed a credit of $41,328.00 could be taken (i.e. 18,450 SF x $2.24 = $41,328.00). The precise fee will be determined upon issuance of Project building permits by the City of Brea Community Development Department.

- ***CMP Compliance Assessment –*** The proposed Project is forecast to generate -1,680 weekday net daily trip-ends and therefore a CMP analysis is not required.

APPENDIX A

TRAFFIC STUDY SCOPE OF WORK

MEMORANDUM

To:	Dave Roseman, P.E., City Traffic Engineer City of Brea	Date:	April 7, 2021
From:	Richard E. Barretto, P.E., Principal Linscott, Law & Greenspan, Engineers	LLG Ref:	2.19.4157.1
Subject:	***Revised Circulation Assessment Scope of Work for Brea Plaza Expansion Project Brea, California***		

Linscott, Law & Greenspan, Engineers (LLG) is pleased to submit the following Revised Scope of Work for the Circulation Assessment for the proposed Brea Plaza Expansion Project in the City of Brea for your review and approval. It is our understanding that a Circulation Assessment is required to provide consistency with the General Plan. The work program summarized below is based on our current experience within the City and prior coordination efforts with City staff.

Circulation Assessment Scope of Work

A. Project Location: Brea Plaza is an existing retail center addressed at 409-477 S. Associated Road & 1555, 1609, 1623, 1643 E. Imperial Highway that is generally located north of Imperial Highway, west of Associated Road, and east of SR-57 Freeway in the City of Brea, California. ***Figure 1-1*** presents a Vicinity Map that illustrates the general location of the Project and surrounding street system. ***Figure 2-1*** is an existing aerial photograph of the Project site.

B. Project Description: ***Table 2-1*** summarizes the proposed Project development. The existing Brea Plaza includes 165,329 square-feet (SF) of floor area consisting of mixture of retail/commercial use, service/retail shops, a movie theatre, restaurant/ food uses and fast-food restaurants with drive-through. Parking for the retail center currently totals 725 on-site spaces with an additional 180 spaces available in an easement with Mercury Insurance during business hours and all spaces after 5:00 PM and on weekends. It is our understanding that the easement with Mercury Insurance will expire soon. Therefore, all of the project parking demands will be accommodated on-site. Vehicular access to Brea Plaza is now provided via a right-turn only and a full access driveway on Associated Road, and a right-turn only on Imperial Highway plus the signalized intersection of Imperial Highway at SR-57 NB ramps/Brea Plaza.

The proposed Project includes a mixed-use development that consists of 21,355 SF of office space and 189 apartment units. Fifteen (15) of the proposed apartments are considered co-living units, which include five (5) 3-bedroom units and ten (10) four-bedroom units, therefore, to provide a conservative assessment, the co-living unit bedrooms have been counted as individual units for a total apartment count of 229 units. The proposed Project also includes a 387-space

and 10 tandem stall parking structure on the northwest quadrant of the subject property. The implementation of the Project would require the demolition of the existing 18,450 SF movie theatre (Brea Plaza 5 Cinemas) and result in the overall loss of 116 surface parking spaces. ***Figure 2-2*** illustrates the conceptual site plan for the Project prepared by Architects Orange, dated February 10, 2021.

C. Traffic Study Locations: The following thirteen (13) key study intersections have been identified, based on coordination with the City, for which the Project's potential traffic impact is to be assessed.

Key Study Intersections

1. Brea Boulevard at Imperial Highway (Brea/Caltrans)
2. State College Boulevard at Birch Street (Brea)
3. State College Boulevard at Imperial Highway (Brea/Caltrans)
4. SR-57 SB Ramps at Imperial Highway (Brea/Caltrans)
5. SR-57 NB Ramps/Brea Plaza at Imperial Highway (Brea/Caltrans)
6. S. Associated Road at Birch Street (Brea)
7. S. Associated Road at Greenbriar Lane (Brea)
8. S. Associated Road at Imperial Highway (Brea/Caltrans)
9. Kraemer Boulevard at Imperial Highway (Brea/Caltrans)
10. Placentia Avenue at Imperial Highway (Brea/Caltrans)
11. S. Associated Road at Brea Plaza Right-turn only Driveway (Brea)
12. S. Associated Road at Brea Plaza Full access Driveway (Brea)
13. Brea Plaza Right-turn only Driveway at Imperial Highway (Brea/Caltrans)

However, inconsideration of the City's "50 peak hour trip" threshold, only two (2) of the potential study locations, SR-57 SB Ramps at Imperial Highway (No. 4) and SR-57 NB Ramps/Brea Plaza at Imperial Highway (No. 5), meets the criteria and hence would warrant evaluation. Given the proximity of the following nine (9) study locations are recommended for evaluation. Subject to confirmation by the City Traffic Engineer, Level of Service (LOS) calculations would be prepared at these locations.:

4. SR-57 SB Ramps at Imperial Highway (Brea/Caltrans)
5. SR-57 NB Ramps/Brea Plaza at Imperial Highway (Brea/Caltrans)
6. S. Associated Road at Birch Street (Brea)
7. S. Associated Road at Greenbriar Lane (Brea)
8. S. Associated Road at Imperial Highway (Brea/Caltrans)
10. Placentia Avenue at Imperial Highway (Brea/Caltrans)

11. S. Associated Road at Brea Plaza Right-turn only Driveway (Brea)
12. S. Associated Road at Brea Plaza Full access Driveway (Brea)
13. Brea Plaza Right-turn only Driveway at Imperial Highway (Brea/Caltrans)

The remaining four (4) locations do not meet the "50 peak hour trip" threshold and would not warrant analysis, subject to review/confirmation by City staff (See ***Table 5-2*** for added project-related traffic volumes). Of the nine (9) recommended study locations, five (5) locations are under Caltrans jurisdiction. *Figure 1-1* identifies the study locations.

D. Traffic Counts: Based on current conditions, due to COVID-19 virus, the ability to collect traffic counts to establish baseline conditions is not possible. As such, to establish existing "baseline" traffic conditions, pre-COVID-19, LLG has researched historical data and was able to obtain Year 2018/2019 counts at five (5) of the nine key study locations. ***Table 1*** presents a summary of the study intersections with available historical data.

Given the availability of historical data, LLG proposes the following to establish pre-COVID-19 traffic conditions:

(1) Historic data is available at five (5) locations for Year 2018/2019.

(2) Given data is not available at one (1) study location (Intersection #7 – not including the existing Brea Plaza driveways), LLG collected Year 2020 Covid-19 traffic counts at the study location, as well as intersections adjacent to the missing intersections, in October 2020 for use in establishing traffic counts/turning movement percentages. *Table 1* indicates the intersections which required new count collection.

(3) Using information from (1) and (2), compare 2018/2019 to 2020 to establish change in traffic counts due to current COVID-19 environment.

(4) Apply the rate calculated in (3) to 2020 COVID-19 traffic counts and forecast 2018/2019 traffic conditions at the one (1) missing intersection (Intersection #7).

(5) Lastly, apply an annual growth factor of 1% per year to the Year 2018/2019 traffic conditions to establish Year 2021 pre-COVID-19 baseline traffic conditions.

Additionally, the existing ingress and egress volumes for the Brea Plaza driveways (Intersections 5, 11, 12 and 13) will be based on forecasted trips for the existing center rather than applying adjustments in place of collecting traffic counts.

LINSCOTT LAW & GREENSPAN engineers

E. Project Traffic Generation: The trip generation potential of the proposed Project will be estimated using trip rates contained in the 10th Edition of *Trip Generation,* published by the Institute of Transportation Engineers (ITE), [Washington, D.C., 2017].

Table 5-1 summarizes the trip generation rates used in forecasting the vehicular trips generated by the proposed Project based on the entire Brea Plaza retail center and also presents the project's forecast peak hour and daily traffic volumes. As shown in the upper portion of *Table 5-1,* ITE Land Use 221: Multifamily Housing (Mid-Rise), ITE 444: Movie Theater, ITE 710: General Office Building, and ITE 820: Shopping Center trip rates will be used to forecast the trip generation potential of the Project, as well as the trip generation potential of a fully occupied existing Brea Plaza.

A review of the middle portion of *Table 5-1* indicates that a fully occupied Brea Plaza is forecast to generate approximately 8,963 daily trips, with 202 trips (126 inbound, 76 outbound) produced in the AM peak hour and 576 trips (283 inbound, 293 outbound) produced in the PM peak hour on a "typical" weekday, and 12,644 daily trips with 1,261 trips (646 inbound, 615 outbound) produced in the Midday peak hour on a "typical" Saturday.

A review of the lower portion of *Table 5-1* indicates that the trip generation associated with Brea Plaza upon implementation of the proposed Project is forecast to generate approximately 7,283 daily trips, with 302 trips (165 inbound, 137 outbound) produced in the AM peak hour and 516 trips (250 inbound, 266 outbound) produced in the PM peak hour on a "typical" weekday, and 10,362 daily trips with 772 trips (370 inbound, 402 outbound) produced in the Midday peak hour on a "typical" Saturday.

When the existing Brea Plaza is compared to the retail center with the proposed Project, the implementation of the proposed Project is forecast result in 1,680 *fewer* weekday daily trips, 100 *more* weekday AM peak hour trips, and 60 *fewer* weekday PM peak hour trips, as well as 2,282 *fewer* Saturday daily trips, and 489 *fewer* Saturday midday trips. As a result of trips documented in *Table 5-1,* which identifies changes to the Saturday daily and peak hour trips, a Saturday analysis is not recommended.

F. Project Trip Distribution Pattern: See attached ***Figures 5-1*** through ***5-4*** for the Project Trip Distribution for the existing retail land uses, proposed retail land uses, proposed residential, and proposed office, respectively, for review by the

City. The project trip distributions have been distributed and assigned to the adjacent street system based on the following considerations:

- location of site access points in relation to the surrounding street system,
- the site's proximity to major traffic carriers and regional access routes,
- physical characteristics of the circulation system such as lane channelization and presence of traffic signals that affect travel patterns,
- presence of traffic congestion in the surrounding vicinity, and
- ingress/egress availability at the project site.

Table 5-2 summarizes the added Project-related AM peak hour and PM peak hour traffic volumes at the initial thirteen (13) potential study locations.

G. Near-Term Cumulative Background Traffic:

- Project Completion Year: 2024 (to be confirmed by the City/Project Applicant)
- Ambient Growth Rate: 1% per year
- Cumulative Projects: Planned and/or approved projects will be researched at the City of Brea and adjacent jurisdictions (i.e. Fullerton, La Habra, Yorba Linda, and Placentia).

H. General Plan Buildout Traffic: General Plan Buildout (Year 2045) traffic volume forecasts will be developed based on OCTAM 5.0 approved computer traffic model runs for baseline conditions and buildout conditions for the AM and PM peak periods and daily traffic conditions. Forecast future buildout traffic volumes using the following methodology:

a. Peak period traffic volumes will be converted to peak hour (i.e., one-hour) traffic volumes using a conversion factor of 0.3566 for the AM peak hour and 0.2662 for the PM peak hour;
b. Calculate the difference between the baseline and buildout peak period traffic volumes and convert to AM and PM peak hour (i.e., one-hour) link traffic volumes;
c. Link traffic volumes (i.e., two-way directional traffic volumes on each roadway segment) will be post-processed using the “b-turns” program and the relationship of the base year validation model run output to the base year "ground" traffic counts to develop buildout AM and PM peak hour traffic volumes.

I. Analysis Scenarios: Prepare AM and PM peak hour Level of Service (LOS) calculations at the nine (9) key study intersections to determine the potential impacts of the proposed Project. The following traffic scenarios will be prepared.

1. Existing (Year 2021) Traffic Conditions;
2. Near-Term (Year 2024) Background Traffic Conditions (Existing plus Ambient Growth plus Related Projects);
3. Near-Term (Year 2024) Background Plus Project Traffic Conditions;
4. Scenario (5) with improvements to be implemented as conditions of approval (COA), if necessary;
5. General Plan Buildout[1] (Year 2045) Traffic Conditions;
6. General Plan Buildout (Year 2045) Plus Project Traffic Conditions; and
7. Scenario (8) with improvements to be implemented as conditions of approval (COA), if necessary.

J. LOS Methodology: The LOS calculations will be based on the HCM 6th Edition methodology for both signalized and unsignalized intersections to be consistent with the City of Brea Transportation Impact Analysis (TIA) Guidelines. Additionally, the LOS calculations will also be based on the Intersection Capacity Utilization (ICU) methodology for signalized intersections to be consistent with the City of Brea General Plan.

The HCM calculations will utilize the following parameters:

- Utilization of exiting cycle length and pedestrian timing parameters,
- Minimum left-turn split time, including clearance interval timing = 10 seconds
- Saturation flow rates:
  - Thru and Right-turns = 1,900 vehicles per hour (vph)
  - Left-turns = Single Lane: 1,800 vph, Dual Lanes = 3,500 vph

The ICU calculations will utilize the following parameters:

- Lane capacity of 1,700 vph for through and all turn lanes with a clearance adjustment factor of 0.05

Subject to confirmation by the City Traffic Engineer, the following LOS review criteria will be used to assess the need for potential Project-related improvements in relation to the guidance provided in the City of Brea General Plan:

- HCM Methodology:
  - The Project causes one or more study intersections operating at LOS D or better to degrade to LOS E or F, or
  - The Project causes a change in control delay of 4 seconds for intersections already operating at LOS E, or
  - The Project causes a change in control delay of 2 seconds for intersections already operating at LOS F.

[1] It should be noted that the General Plan Buildout assessment has been included since the proposed Project would require an amendment to the General Plan to accommodate a change is Zoning to allow for residential uses.

- ICU Methodology:
  - The Project causes an intersection operating at LOS D or better to degrade to LOS E or F, or
  - The Project increases traffic demand at a signalized study intersection by 0.020 or greater and the intersection is forecast to operate at LOS E or F.

K. Other Issues:

- Evaluate site access and internal circulation of the proposed Project.
- Conduct a safety evaluation at all key study intersections which will include 5 years of collision history data. Recommend physical and/or timing changes to improve safety where applicable.
- Conduct a queuing evaluation at all key study intersections located along Imperial Highway and Associated Road, inclusive of the SR-57 off-ramps to Imperial Highway to address potential Caltrans concerns/comments.
- Perform an active transportation facilities assessment of the near-by roadways as it relates to pedestrian mobility and bicycle mobility.
- Provide documentation of existing near-by transit facilities and transit routes that provide services to the site.
- Since the project driveway on Imperial Highway is approximately 150 feet from the SR-57 NB On-ramp, conduct an operations weaving assessment between driveway and freeway on-ramp for the westbound direction of Imperial Highway. This weaving assessment will be conducted via Synchro 10.0.
- Prepare a standalone VMT screening memo.

L. OCTA NOP Comments: The comments have been reviewed and the contents of this scope of work adequately addresses all comments.

M. City of Fullerton NOP Comments: The comments have been reviewed and the contents of this scope of work have been updated to address all comments. However, the City of Fullerton has requested for LOS analyses to include intersections along Associated Road and State College Boulevard, between Imperial Highway and CSU Fullerton. Review of the project's trip generation and trip distribution patterns indicate that intersections along those roadways would not satisfy the 50-trip threshold criteria. Therefore, project trips at these intersections are considered

nominal and have not been included in the scope of work. Language will be added to the report to further discuss why these intersections were excluded from analysis.

N. Caltrans NOP Comments: The comments have been reviewed and the contents of this scope of work have been updated to address all comments.

O. Neighborhood Scoping Meeting Comments: The comments have been reviewed and the contents of this scope of work adequately addresses all comments. As it relates to congestion along Imperial Highway resulting in cut-through traffic along Associated Road and Castlegate/Placentia, this is believed to be an existing issue that currently happens. Therefore, the analysis at the key study intersections will identify if additional improvements are needed to satisfy existing and future traffic demands.

* * * * * * * * * *

We appreciate the opportunity to provide this scope of work. Should you have any questions, please call us at (949)825-6175. Thank you.

2 Project development summary is based on project site plan prepared by Architects Orange, dated February 10, 2021.

3 There is a total of 189 apartment units. A portion of the proposed apartments are considered co-living units, which include five (5) 3-bedroom units and ten (10) 4-bedroom units. Therefore, to provide a conservative assessment, the co-living unit bedrooms have been counted as individual units for a total apartment count of 229 units.

4 Currently, there are a total of 725 parking stalls plus an additional 180 spaces during business hours and all surface spaces after 5PM and weekend through an easement with Mercury Insurance. However, the easement with Mercury Insurance will no longer be applicable as part of the proposed Project and all of the project parking demands will be accommodated on-site.

5 Source: *Trip Generation*, 10th Edition, Institute of Transportation Engineers (ITE), Washington, D.C. (2017).

6 Trip Generation rates based on the following equations:
- Weekday Daily: Ln(T) = 0.68Ln(X) + 5.57
- Weekday AM Peak Hour: T = 0.50(X) + 151.78
- Weekday PM Peak Hour: Ln(T) = 0.74Ln(X) + 2.89
- Saturday Daily: Ln(T) = 0.62Ln(X) + 6.24
- Saturday Peak Hour of Generator: Ln(T) = 0.79Ln(X) + 2.79

7 Pass-By Trips are trips made as intermediate stops on the way from an origin to a primary trip destination. Pass-by trips are attracted from traffic passing the site on adjacent streets, which contain direct access to the generator. For this analysis, the following pass-by reduction factors were used (Source: *Trip Generation Handbook,3rd Edition*, ITE 2017):
- 820: Shopping Center: PM Peak Hour – 34%, Daily/AM peak hour/Saturday Daily/Saturday Midday Peak Hour – Assume 10%

8 Consistent with the *Trip Generation Handbook,* published by ITE (2017), Project trip generation was adjusted to account for internal capture between the retail and residential components of the Project. As there are no Saturday internal capture worksheets available, Weekday Daily and Weekday PM peak hour calculations have been applied to Saturday Daily and Saturday Midday peak hour.

Intersection Signal Delay: 26.2		Intersection LOS: C	
Intersection Capacity Utilization 66.5%		ICU Level of Service C	
Analysis Period (min) 15			

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Maximum v/c Ratio: 0.91			
Intersection Signal Delay: 26.5		Intersection LOS: C	
Intersection Capacity Utilization 82.3%		ICU Level of Service E	
Analysis Period (min) 15			

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 2: SR-57 NB Off-Ramp/Brea Plaza Dwy 1 & Imperial Hwy

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Area Type:	Other		
Cycle Length: 120			
Actuated Cycle Length: 120			
Offset: 77 (64%), Referenced to phase 4:EBT and 8:WBT, Start of Green			
Natural Cycle: 120			
Control Type: Actuated-Coordinated			
Maximum v/c Ratio: 1.09			
Intersection Signal Delay: 63.4		Intersection LOS: E	
Intersection Capacity Utilization 71.6%		ICU Level of Service C	
Analysis Period (min) 15			

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Area Type: Other
Cycle Length: 120
Actuated Cycle Length: 120
Offset: 116 (97%), Referenced to phase 4:EBT and 8:WBT, Start of Green
Natural Cycle: 120
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 1.02
Intersection Signal Delay: 41.0 Intersection LOS: D
Intersection Capacity Utilization 87.7% ICU Level of Service E
Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 6: Castlegate Ln/Placentia Ave & Imperial Hwy

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Offset: 4 (3%), Referenced to phase 4:EBT and 8:WBT, Start of Green			
Natural Cycle: 85			
Control Type: Actuated-Coordinated			
Maximum v/c Ratio: 0.85			
Intersection Signal Delay: 16.6		Intersection LOS: B	
Intersection Capacity Utilization 77.2%		ICU Level of Service D	
Analysis Period (min) 15			

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 6: Castlegate Ln/Placentia Ave & Imperial Hwy

Intersection Signal Delay: 43.7		Intersection LOS: D	
Intersection Capacity Utilization 87.8%		ICU Level of Service E	
Analysis Period (min) 15			

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Offset: 0 (0%), Referenced to phase 4:EBT and 8:WBT, Start of Green			
Natural Cycle: 85			
Control Type: Actuated-Coordinated			
Maximum v/c Ratio: 0.85			
Intersection Signal Delay: 16.1		Intersection LOS: B	
Intersection Capacity Utilization 73.9%		ICU Level of Service D	
Analysis Period (min) 15			

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 6: Castlegate Ln/Placentia Ave & Imperial Hwy

Intersection Summary

Area Type: Other
Cycle Length: 120
Actuated Cycle Length: 120
Offset: 0 (0%), Referenced to phase 4:EBT and 8:WBT, Start of Green
Natural Cycle: 120
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 1.10
Intersection Signal Delay: 66.1 Intersection LOS: E
Intersection Capacity Utilization 91.8% ICU Level of Service F
Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 5: Associated Rd & Imperial Hwy

Intersection Summary			
Area Type:	Other		
Cycle Length: 120			
Actuated Cycle Length: 120			
Offset: 4 (3%), Referenced to phase 4:EBT and 8:WBT, Start of Green			
Natural Cycle: 85			
Control Type: Actuated-Coordinated			
Maximum v/c Ratio: 0.85			
Intersection Signal Delay: 16.5		Intersection LOS: B	
Intersection Capacity Utilization 77.1%		ICU Level of Service D	
Analysis Period (min) 15			

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 6: Castlegate Ln/Placentia Ave & Imperial Hwy

Intersection Summary

Area Type: Other
Cycle Length: 120
Actuated Cycle Length: 120
Offset: 74 (62%), Referenced to phase 4:EBT and 8:WBT, Start of Green
Natural Cycle: 100
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 0.81
Intersection Signal Delay: 32.5 Intersection LOS: C
Intersection Capacity Utilization 63.2% ICU Level of Service B
Analysis Period (min) 15
95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 3: Associated Rd & Birch St

Subject: Parking Study for Brea Plaza Shopping Center, Brea, California

Dear Mr. Nadhir:

LSA is pleased to submit this parking study for the proposed renovation of the Brea Plaza Shopping Center (project) in Brea, California. The project site is along Imperial Highway between State Route 57 (SR-57) and Associated Road. This analysis is based on the project site plan dated February 24, 2021 (Figure 1 in Attachment A). The proposed project would demolish an 18,450 square foot (sf) theater and some existing surface parking spaces. In the place of the demolished uses, the proposed project would construct 189 residential units and 21,355 sf of office space. Of the 189 proposed residential units, 19 would be designated affordable housing, and 15 would be configured as coliving units (separate bedrooms sharing a common living space), the market rent of which is more affordable than that of traditional apartments. The remaining 155 dwelling units would be traditional market rate apartments.

The renovation project would include travel demand management strategies including bicycle parking, a lounge for rideshare drivers, subsidized car sharing for the residents, and a proposed new bus stop. Strategies such as these can reduce the overall parking demand. Many of the site's proposed uses experience their peak parking demand at different times of day. This means that the completed development may require fewer parking spaces when considered as a whole than would otherwise be required by straight application of the City of Brea (City) Municipal Code. This report analyzes the potential parking demand for the proposed uses during a typical weekday, during a typical weekend, and during December as requested by the City's peer review consultant.

MUNICIPAL CODE PARKING RATES AND REQUIREMENTS

Brea Municipal Code (BMC) Section 20.08.040 establishes off-street parking requirements for residential and nonresidential development. Table A presents the parking requirements for each type of use on the site.

BMC Section 20.08.040 specifically states that where uses are combined, the parking requirement is the sum of the requirements of the various uses, except for shopping centers. Therefore, Table B calculates the existing parking requirement based on the total size of the shopping center. It should be noted, however, that Table A shows that some of the shopping center's uses, such as the movie theater, have a much higher parking demand if considered individually.

Table A: Municipal Code Parking Rates

Land Use	Parking Space Rates per Brea Municipal Code Section 20.08.040
General Retail	1 space per 200 sf
Barbershops and Beauty Parlors	1 space per 250 sf
Cafes/Sit Down Restaurants	Minimum of 10 spaces; 1 space for each 75 sf of gross floor area up to 6,000 sf plus 1 space for each 55 sf over 6,000 sf
Auditoriums/Theaters	1 space per 3 fixed seats or 1 space per 35 sf
Medical/Dental Offices	5.5 spaces per 1,000 sf
Shopping Centers	5.5 spaces per 1,000 sf
Offices	1 space per 250 sf
Two or More Dwelling Units on One Building Site	1.5 spaces per studio unit, 1.75 spaces per 1-bedroom unit, 2.0 spaces per 2-bedroom unit, 2.5 spaces per 3-bedroom unit, or 3.0 spaces per 4-bedroom unit, plus 0.2 guest space per unit

Source: City of Brea Municipal Code Section 20.08.040
sf = square feet

Table B: Existing Municipal Code Parking Requirement

Land Use	Parking Space Rates per Brea Municipal Code Section 20.08.040	Project Parking Requirements		
		Size	Unit	Required Parking Spaces
Shopping Centers	5.5 spaces per 1,000 sf	165.329	TSF	909
			TOTAL	**909**

sf = square feet
TSF = thousand square feet

LSA calculated how the proposed project would affect the BMC parking requirement. As Table A shows, the BMC establishes different parking rates based on the type of residential unit. The BMC does not, however, provide a specific parking requirement for coliving units. Coliving residential units provide private sleeping space and shared common space such as a living room, a kitchen, and laundry facilities. The reduction in total floor area from sharing common space results in market rate rent that is lower than typically configured apartments. Coliving dwelling units provide an affordable housing option that does not require subsidy from the other apartment units. This living configuration has proven successful in urban markets where coliving residential developments have been operating for a few years.

The proposed coliving units would have a common living room, a full kitchen, and a laundry area. Each private bedroom would include a kitchenette and would have a bathroom either en suite or adjacent to the bedroom. Five coliving units would have three bedrooms each, and 10 coliving units would have four bedrooms each. Table C displays the calculation of the BMC parking requirement for the residential portion of the proposed project.

Table C: Residential Municipal Code Parking Requirement

Land Use	Parking Space Rate per Brea Municipal Code Section 20.08.040	Project Parking Requirements	
		Units	Required Parking Spaces
Studio	1.5 spaces per studio unit	16	24
1-Bedroom Unit	1.75 spaces per 1-bedroom unit	109	191
2-Bedroom Unit	2.0 spaces per 2-bedroom unit	44	88
3-Bedroom Unit	2.5 spaces per 3-bedroom unit	5	12.5
Coliving 3-bedroom Unit	2.5 spaces per 3-bedroom unit	5	12.5
Coliving 4-bedroom Unit	3.0 spaces per 4-bedroom unit	10	30
Guest Parking	0.2 space per unit	189	37.8
		TOTAL	**396 (395.8)**

Within the existing 165,329 sf shopping center, the proposed project would demolish the 18,450 sf movie theater. At the completion of construction, the shopping center would provide 146,879 sf of leasable commercial space (165,329 - 18,450 = 146,879). This accounts for all uses in the shopping center other than the new office and residential development. The proposed project would construct 21,355 sf of new office space in a new second floor above a portion of the existing shopping center. Table D shows that the BMC parking requirement upon completion of the proposed project would be 1,289 parking spaces for all Brea Plaza uses.

Table D: Future Municipal Code Parking Requirement

Land Use	Parking Space Rates per Brea Municipal Code Section 20.08.040	Parking Requirements		
		Size	Unit	Required Parking Spaces
Shopping Centers	5.5 spaces per 1,000 sf	146,879	TSF	808
Offices	1 space per 250 sf	21,355	sf	85
Two or More Dwelling Units on One Building Site	1.5 spaces per studio unit, 1.75 spaces per 1-bedroom unit, 2.0 spaces per 2-bedroom unit, 2.5 spaces per 3-bedroom unit, or 3.0 spaces per 4-bedroom unit, plus 0.2 guest space per unit	189	du	396[1]
			TOTAL	**1,289**

[1] See Table C.
du = dwelling unit
sf = square feet
TSF = thousand square feet

While a comparison between Table B and Table D shows a large increase in the BMC parking requirement as a result of the proposed project, it should be noted that the proposed project is replacing the most parking-intensive portion of the Brea Plaza Shopping Center (i.e., the movie theater). Table E calculates BMC parking requirements for the individual uses that would be demolished or added as a result of the proposed project. A comparison of Tables B and D shows that straight application of the BMC, treating all uses within the shopping center equivalently, estimates that the proposed project would require 380 more parking spaces than the existing condition. However, the more fine-grained consideration of the land use being replaced in Table E shows that the proposed project would reduce the parking requirement by 46 parking spaces.

Table E: Comparison of Individual Parking Rates

Land Use	Parking Space Rates per Brea Municipal Code Section 20.08.040	Parking Requirements		
		Size	Unit	Required Parking Spaces
Existing Uses to Be Replaced				
Auditoriums/Theaters	1 space per 3 fixed seats or 1 space per 35 sf	18,450	sf	527
			Total Deleted Parking	**527**
Future Uses to Be Added				
Offices	1 space per 250 sf	21,355	sf	85
Two or More Dwelling Units on One Building Site	1.5 spaces per studio unit, 1.75 spaces per 1-bedroom unit, 2.0 spaces per 2-bedroom unit, or 2.5 spaces per 3-bedroom unit, plus 0.2 guest spaces per unit	189	du	396[1]
			Total Added Parking	**481**
			Net Parking Effect of Proposed Project	**(46)**

[1] See Table C.
du = dwelling unit
sf = square feet

PARKING SUPPLY

Existing Parking Supply

When originally constructed in the late 1970s, the Brea Plaza Shopping Center and the neighboring office building (1700 Greenbriar Lane) were constructed as one project with access and parking rights shared between the shopping center and office building. The Brea Plaza Shopping Center and the Mercury Insurance office building are now under separate ownership, but an access and parking agreement is in place permitting shared access across the Brea Plaza Shopping Center site, specifying Brea Plaza Shopping Center use of portions of the 443 surface parking spaces at all times and full access outside office business hours. This access and parking agreement is in effect until 2026. This parking analysis demonstrates that the project will not rely on the Mercury Insurance parking lot to satisfy typical daily or weekend parking demand.

LSA contracted with an independent data collection company to survey the parking supply in the existing parking lot. Table F details the surface parking lot on Brea Plaza Shopping Center property. As Table F shows, the existing surface parking lot provides 739 parking spaces. The Mercury Insurance office building is supported by 443 surface parking spaces and a 465-space parking structure. Parking surveys are attached to this report (Attachment B).

Future Parking Supply

The proposed project would be constructed in the northwest parking lot, which would eliminate 139 parking spaces. Figure 1 shows that upon completion of the proposed project, the Brea Plaza Shopping Center will have 600 surface parking spaces.

Table F: Existing Brea Plaza Shopping Center Parking Supply

	ADA	Standard	Compact	Reserved/ Time Limited	Loading/ Back of House	Total
Northwest Lot	6	105	37	0	2	150
Southwest Lot	8	72	0	20	0	100
Imperial Highway Pad Buildings	8	63	0	0	0	71
Northeast Lot	4	38	0	2	4	48
Central Lot	11	309	30	20	0	370
TOTAL	**37**	**587**	**67**	**42**	**6**	**739**

ADA = Americans with Disabilities Act

A parking structure will be constructed as part of the proposed project. At this time, striping plans for the parking structure indicate that 397 parking spaces will be provided, of which 20 will be provided in tandem configuration (10 tandem spaces with 2 spaces each). As shown in Figure 1, access into and out of the parking structure will be provided along a north-south drive aisle leading to the signalized intersection of SR-57 northbound ramps/Imperial Highway.

Residents and their guests would park in the parking structure. Five of the tandem parking stalls would be assigned to the five 3-bedroom units, and five of the tandem parking stalls would be assigned to 2-bedroom units. However, no sequestered parking area is anticipated for the remainder of the units at this time. As discussed later in this report, unbundling residential parking is an effective travel demand management strategy. Residents would be issued overnight parking permits that would allow onsite security to distinguish resident vehicles.

Upon completion of the proposed project, a total of 997 parking spaces will be located within the Brea Plaza Shopping Center, an increase of 258 parking spaces from the existing parking supply. This is lower than the BMC parking requirement, but in combination with the flexible parking supply within the parking easement, it is anticipated to accommodate the peak parking demand of the proposed project.

PARKING DEMAND

Published Survey Data

The Institute of Transportation Engineers (ITE) *Parking Generation*, Fifth Edition,[1] provides information based on three decades of research. This resource identifies average parking rates and a confidence interval that assists with analysis of properties with the potential for higher- or lower-than-average parking demand. For the Brea Plaza Shopping Center, the high end of the confidence interval would likely be appropriate. Table G displays the average parking rates and high end of the confidence interval.

[1] Institute of Transportation Engineers. 2019. *Parking Generation*. 5th ed.

Table G: Institute of Transportation Engineers Parking Rates

Land Use (Land Use Code)	Average Rate	Upper Confidence Interval
Shopping Center (820)	1.95 spaces per TSF	2.17 spaces per TSF
Supermarket (850)	2.93 spaces per TSF	4.07 spaces per TSF
High-Turnover (Sit Down) Restaurant (932)	9.44 spaces per TSF	10.92 spaces per TSF
Movie Theater (444)	7.45 spaces per TSF	11.08 spaces per TSF
Medical/Dental Offices (720)	3.23 spaces per TSF	3.42 spaces per TSF
General Office Building (710)	2.39 spaces per TSF	2.50 spaces per TSF
Multifamily Housing (Mid-Rise) (221)	1.31 spaces per dwelling unit or 0.75 space per bedroom	1.36 spaces per dwelling unit or 0.80 space per bedroom

Source: Institute of Transportation Engineers. 2019. *Parking Generation*. 5th ed.
TSF = thousand square feet

Residential Parking Demand

For midrise multifamily housing in a suburban area, the ITE surveyed average peak parking demand ratio is 1.31 spaces per dwelling unit or 0.75 space per bedroom. For this land use, the upper end of the 95 percent confidence interval is 1.36 spaces per dwelling unit or 0.80 space per bedroom.

Surveys of Similar Sites

As mentioned above, the proposed residential building would provide parking in the parking structure with open parking stalls and no individual garages. Multifamily housing developments with individual garages sometimes find that garages transition to storage use over time, which increases the burden on the remaining open parking spaces. Structured parking cannot be used for storage and will always be used for parking.

LSA had collected parking demand data at three large apartment developments with structured parking in 2019. The parking data is recent but also represents typical conditions prior to Covid-19. The three sites surveyed were the Core Apartments at 1815 Westside Drive in Anaheim, the Baker Block development at 125 Baker Street in Costa Mesa, and Rize at 1100 Synergy in Irvine. All three of these apartment developments are midrise and provide all of their parking in an adjoining parking structure. None of the three identified properties have private garages.

LSA contracted with an independent data collection company to collect parking accumulation data from 5:00 p.m. to midnight for weekdays and weekends at each of the identified properties. Survey data is provided in Attachment C. This period was selected to reflect the time of day when Urban Land Institute (ULI) *Shared Parking* time-of-day data identifies peak resident and residential guest parking demand.[1] Table H displays the results of those surveys including the resulting ratios of parking spaces per dwelling unit and parking spaces per bedroom. For the Core Apartments, parking ratios were based on the units occupied at the time the surveys were conducted. Property management for Baker Block and Rize reported full occupancy at the time of the parking surveys.

[1] Urban Land Institute. 2020. *Shared Parking*. 3rd ed.

Table H: Apartment Parking Survey Results

	Core Apartments[1]			Baker Block			Rize	
	222 dwelling units, 328 bedrooms, and 726 parking spaces			240 dwelling units, 349 bedrooms, and 466 parking spaces			363 dwelling units, 511 bedrooms, and 564 parking spaces	
	Thursday 4/25/19	Friday 4/26/19	Saturday 4/27/19	Thursday 5/2/19	Friday 5/3/19	Saturday 5/4/19	Tuesday 8/6/19	Saturday 7/27/19
Peak Parked Cars	306	288	295	310	311	297	429	442
Parking Rate per Unit	1.38	1.30	1.33	1.29	1.30	1.24	1.18	1.22
Parking Rate per Bedroom	0.93	0.88	0.90	0.89	0.89	0.85	0.84	0.86

[1] At the time of the surveys, 222 of the 400 units were occupied.

Table I summarizes the parking rates for the three surveyed midrise apartment developments with structured parking. As Table I shows, the average observed parking rate for midrise apartments in Orange County with structured parking is 1.30 spaces per dwelling unit or 0.89 space per bedroom.

Table I: Average Apartment Parking Rates

	Peak Parking Rate per Dwelling Unit	Peak Parking Rate per Bedroom
Core Apartments	1.38	0.93
Baker Block	1.30	0.89
Rize	1.22	0.86
Average	**1.30**	**0.89**

It should be noted that the presence of on-street parking near each surveyed property likely resulted in resident guests choosing these spaces out of convenience. LSA queried parking survey data in ULI's *Shared Parking*, Third Edition,[1] which identifies a guest parking ratio of 0.10 parking space per dwelling unit. Based on the empirical data for similar developments in the same county, LSA believes that parking demand for the market rate units of the proposed project could be accommodated by providing 1.40 parking spaces per studio and one-bedroom dwelling unit (1.30 for residents and 0.10 for guests), 1.90 parking spaces per two-bedroom dwelling unit (0.89 resident space per bedroom x 2 bedrooms + 0.10 guest space), and 2.8 parking spaces per three-bedroom dwelling unit (0.89 resident space per bedroom x 3 bedrooms + 0.10 guest space).

Affordable Housing Parking Rates

While the section above identifies an appropriate parking ratio for market rate residential units, LSA also considered the appropriate parking ratio for affordable residential units. The State Density Bonus Law provides an exemption for affordable housing units. Specifically, a city cannot compel the provision of more than one space per dwelling unit for studio or one-bedroom units or more than two spaces per dwelling unit for two- or three-bedroom units (California Government Code Section 65915p(1)).

[1] Urban Land Institute. 2020. *Shared Parking*. 3rd ed.

LSA estimated the parking demand for the affordable housing units. The ITE's *Parking Generation*, Fifth Edition,[1] provides information for affordable housing with income limits. For affordable housing in a suburban area, the average peak parking demand ratio is 0.99 space per dwelling unit or 0.54 space per bedroom. For this land use, the upper end of the confidence interval is 1.09 spaces per dwelling unit or 0.82 space per bedroom. These surveyed rates predict higher parking demand for studio and one-bedroom affordable units but lower parking demand for two-bedroom affordable units than the State maximum.

LSA believes that parking demand for the affordable units of the proposed project (including the 15 coliving units, classified as 55 studios) could be accommodated by providing 1.09 parking spaces per studio and one-bedroom dwelling unit and the State maximum 2 parking spaces per two- or three-bedroom dwelling unit.

Total Resident Parking Demand

Table J calculates the anticipated residential parking demand for the 189 proposed residential units based on the available empirical data and the function of the units (i.e., Table J accounts for the parking demand of coliving bedrooms). As Table J shows, a total residential parking demand for 328 parking spaces is anticipated. Of this total, 23 parking spaces would be used by guests and 305 would be used by apartment residents. As mentioned above, most residents would not have assigned parking spaces but would have overnight parking permits, allowing on-site security to distinguish resident vehicles. The anticipated residential parking demand for 328 parking spaces is lower than the BMC rate of 396 parking spaces but accounts for the parking characteristics of affordable housing and the greater efficiency of parking lots without private garages.

Shared Parking

The sections above describe the peak parking demand for the proposed residential development that is one of multiple land uses within the proposed project. Because of different hours of operation and different offsetting parking activities, not all uses at the site require their full allotment of parking spaces at the same time. Logically, the project's apartment residents could patronize the on-site retail and restaurant uses, and the site would not have to simultaneously provide a parking space for the resident as a resident and the resident as a customer. LSA used methodologies found in ULI's *Shared Parking*, Third Edition,[2] to identify the daily variations in parking demand for each of the site's land uses. Applying these methodologies avoids double counting parking demand. The time-of-day factors found in *Shared Parking* are based on empirical studies and results from multiple parking accumulation counts. For all uses other than the residential development, LSA applied the BMC parking requirement. In order to determine an individual land use portion of the shopping center parking requirement, LSA calculated a ratio based on individual land use parking rates.

---

2 Urban Land Institute. 2020. *Shared Parking*. 3rd ed.

Table J: Residential Parking Demand

Land Use	Parking Demand Rates per Empirical Data	Project Parking Requirements	
		Units	Required Parking Spaces
Market Rate Studio Unit	1.40 spaces per dwelling unit	14	19.6
Affordable Studio Unit	1.09 spaces per dwelling unit	2	2.2
Market Rate 1-Bedroom Unit	1.40 spaces per dwelling unit	98	137.2
Affordable 1-Bedroom Unit	1.09 spaces per dwelling unit	11	12.0
Market Rate 2-Bedroom Unit	1.9 spaces per dwelling unit	39	74.1
Affordable 2-Bedroom Unit	2.0 spaces per dwelling unit	5	10.0
Market Rate 3-Bedroom Unit	2.8 spaces per dwelling unit	4	11.2
Affordable 3-Bedroom Unit	2.0 spaces per dwelling unit	1	2.0
Coliving Bedrooms (5 3-bedroom and 10 4-bedroom units)	1.09 spaces per bedroom	55	60.0
Total		**189**[1]	**328 (328.3)**
Guest (0.1 space per dwelling unit)			23
Resident			305

[1] Of the 189 proposed dwelling units, 15 coliving units have a total of 55 bedrooms.

Table K identifies that peak parking demand for the site is anticipated to occur in the early evening, when residents have returned to the proposed apartment community. At the time of peak parking demand, the Brea Plaza Shopping Center is estimated to require 966 parking spaces. In the early afternoon, when commercial retail parking demand and office parking demand are near their peak, demand for 965 parking spaces is anticipated.

In addition to typical weekday time-of-day factors, *Shared Parking* includes tables with time-of-day factors on typical weekends and during December, which is usually the busiest time of year for retail shopping centers. *Shared Parking* includes typical weekday and weekend parking rates for several land uses based on empirical data. LSA applied the ratios of weekend-to-weekday parking rates to the weekday peak parking required for each land use in Table K. Then, the weekend time-of-day factors were applied to determine peak weekend parking demand. Table L displays the weekend shared parking calculations. As Table L shows, the peak parking demand is anticipated to occur in the early afternoon with 979 parked cars. Total parking demand in the evening is anticipated to be slightly lower, at 967 parked cars.

Shared Parking includes data in the yearly variation in parking demand for several uses. LSA sought to verify this data with site-specific data. While historic parking surveys were not available, LSA did have access to historic data of sales by month. LSA calculated ratios of December customer demand compared to average customer demand using variation in sales as a proxy for variation in parking demand. These varied very little from the data presented in *Shared Parking*, with slightly higher restaurant demand and slightly lower retail demand during December in the site-specific data. These December factors were applied to the typical peak parking required, and December time-of-day factors were applied. Table M displays the December shared parking calculations. As Table M shows, the peak parking demand is anticipated to occur in the early afternoon with 1,079 parked cars. Total parking demand in the evening is anticipated to be slightly lower, at 1,015 parked cars.

[1] The time-of-day factors are referenced from the Urban Land Institute's *Shared Parking*, Third Edition (2020).

COMPARING PARKING SUPPLY AND DEMAND

In the existing condition, the Brea Plaza Shopping Center has a BMC parking requirement for 909 parking spaces, of which 739 spaces are provided on site. However, it should be noted that if parking demand were calculated individually, the movie theater alone would require 527 parking spaces, which would significantly increase the total parking requirement.

The realistic implication of the proposed project is that the most parking-intensive portion of the Brea Plaza Shopping Center is being eliminated. Table E showed that the replacement land uses have an approximately equivalent parking requirement as the replaced land use. However, the proposed project will construct 258 more parking spaces than exist today. Therefore, the effect of the proposed project will be to bring more balance to the parking supply and demand.

With the proposed project, the BMC parking requirement would increase to 1,289 parking spaces, of which 997 spaces would be provided on site. When considering the proposed project's parking demand management strategies and the effects of shared parking, typical weekday peak parking demand is anticipated to be 966 parking spaces. Typical weekend peak parking demand is anticipated to be 979 parking spaces. It is anticipated that typical weekday and weekend parking demand could be accommodated within the on-site parking supply. Weekend peak parking demand in December is anticipated to be 1,079 parking spaces, which could be accommodated within the flexible parking located within the parking easement. The parking demand generated by the Brea Plaza Shopping Center could be accommodated within the on-site parking supply and, on a peak December weekend, the flexible parking located within the parking easement.

PARKING DEMAND MANAGEMENT STRATEGIES

The sections above demonstrate that the proposed project's parking supply can be less than that determined by straight application of the BMC parking requirements while still providing sufficient parking to satisfy the anticipated parking demand. Limiting parking supply in this manner is consistent with regional planning efforts. For example, Connect SoCal, the 2020–2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) of the Southern California Association of Governments (SCAG), lists "identify ways to 'right size' parking requirements and promote alternative parking strategies" as a strategy for sustainable development.[1] Leveraging technology innovations is another RTP/SCS strategy, which is proposed as part of the proposed project. The proposed project proposes providing a lounge for rideshare drivers and subsidized car sharing for the residents.

Providing a lounge for rideshare drivers helps to ensure the availability of a ride during high-demand times. Because the lounge reduces the time lost waiting for a driver to arrive, the convenience of this alternative to private car ownership is increased. The subsidized car sharing for residents

ensures access to vehicles for purposes not well suited to ridesharing such as longer trips or purchasing bulky items. These project features work together to reduce the need for apartment residents to privately own vehicles. These strategies are supportive of the parking demand calculations presented above. No additional reduction in parking demand has been applied in this analysis because of these strategies.

Limiting parking has benefits to reducing vehicle miles traveled (VMT) and greenhouse gas (GHG) emissions. Mitigation Measure MM-GHG-1 (e) of the RTP/SCS identifies limiting parking supply as a method to encourage alternative transportation modes. In the California Air Pollution Control Officers Association (CAPCOA) publication *Quantifying Greenhouse Gas Mitigation Measures* (CAPCOA manual), strategy PDT-1 identifies a potential VMT and GHG reduction of between 5 and 12.5 percent when reducing parking supply.[1]

The SCAG RTP/SCS mitigation goes further and names unbundling parking costs as a parking management strategy that is particularly effective at reducing travel demand. For an apartment development, unbundling parking would mean charging a base rent for an apartment and an additional a la carte cost per vehicle parking permit. The CAPCOA manual strategy PDT-2 identifies a potential additional VMT reduction of between 2.6 and 13 percent for unbundling parking costs. Allowing unbundled parking costs works to reduce VMT because it reduces parking demand. For example, "Allow for Parking Pricing/Unbundling/Cash-out Requirements" is step 5 in Richard Wilson's book *Parking Reform Made Easy*.[2] Unbundling parking not only reduces VMT and GHG but also is fairer to apartment residents.

Including the price of parking with rent places an unfair burden on renters with lower parking demand. A single parent in a two-bedroom apartment with one car and a group of four adults in a two-bedroom apartment with four cars are charged the same bundled rent-plus-parking cost. This single parent essentially subsidizes the cost of parking for others. Permitting unbundled parking fairly allocates the cost of parking to the generators of parking demand. When multicar households are aware of their parking costs, they can more accurately determine the correct number of cars needed by their household.

On-street parking is not permitted adjacent to the project site. Single-family residential streets with on-street parking are not convenient to the project site, which makes the project site a potentially good location within Brea to demonstrate the ability of unbundled parking to moderate residential parking demand.

Even if full unbundling of parking costs is not possible, strategies to manage the parking demand are still possible. *Parking Reform Made Easy* discusses the effects of reserved versus unreserved parking on parking circulation and the ability to internally share parking spaces.[3] This source points out that a reserved space effectively represents parking demand even when vacant. With fewer assigned

2 Wilson, Richard. 2013. *Parking Reform Made Easy*. Washington, D.C.: Island Press.

3 Ibid., page 105.

parking spaces, the opportunity is greater to internally share parking resources. *Parking Reform Made Easy* estimates that not reserving residential parking spaces can reduce the number of spaces needed by 10 to 20 percent.[1] Again, this strategy is supportive of the parking demand calculations presented above. No additional reduction in parking demand has been applied in this analysis because of this strategy.

The proposed project's strategy of reducing parking supply through maximizing the shared parking pool aligns with regional goals to support sustainable development and reduce VMT and GHG. Maximizing the shared parking pool includes not providing a sequestered parking area for the residential development. Keeping these spaces unreserved provides flexibility to the development and the residents to consider transportation alternatives.

BICYCLE PARKING

The BMC does not currently quantify bicycle parking requirements, but the travel demand management ordinance does state that bicycle parking should be provided for employees commuting to the site. The proposed project is proposing to provide 22 short-term bicycle parking spaces and 108 long-term bicycle parking spaces. Long-term bicycle parking would be located within an enclosed bicycle locker or in a secure parking garage. Short-term bicycle parking should include anchoring that will allow for residents or visitors to lock up their bicycle frame and one wheel to the secured bike rack. Both types of bicycle parking spaces should be located in areas visible to passing vehicles and/or residents to discourage theft.

The bicycle parking spaces would be available to employees and residents. Existing and planned bicycle infrastructure in Brea further supports bicycle commuting. According to the City's Circulation Element, Associated Road has Class II bicycle lanes and a planned Class I facility.[2] The existing Class II bicycle lanes along Associated Road permit travel to the Brea Trail Class I bicycle path. This path along former Pacific Electric right-of-way facilitates east-west travel through Brea.

BUS STOP

Orange County Transportation Authority (OCTA) Bus Route 153 operates adjacent to the Brea Plaza Shopping Center along Associated Road. Route 153 travels between the Brea Mall and the Anaheim Regional Transportation Intermodal Center (ARTIC), which is a major transit stop served by Metrolink and Amtrak trains as well as high-frequency bus service to employment centers in Anaheim.

In the existing condition, Route 153 has a northbound bus stop immediately adjacent to the Brea Plaza Shopping Center at the northeast corner of Associated Road/Imperial Highway. The nearest southbound bus stop is less convenient. One southbound bus stop is located south of Imperial Highway, requiring riders to cross Imperial Highway. These pedestrian crossings of a major arterial are time consuming and inconvenient to riders and have the potential to add delay to vehicles at the intersection. An additional southbound bus stop is located north of the Brea Plaza Shopping Center near Greenbriar Park.

---

1 Wilson, Richard. 2013. *Parking Reform Made Easy*. Washington, D.C.: Island Press.

2 City of Brea. 2003. Circulation Element.

On August 13, 2020, LSA and the project applicant met with OCTA Bus Operations to discuss the possibility of better integrating bus service into the Brea Plaza Shopping Center and the proposed residential development. OCTA preferred a curb-adjacent bus stop along Associated Road to a potential bus stop internal to the site. OCTA indicated that this stop would not require a concrete pad, as it would be similar to the existing bus stops along Associated Road.

The proposed location for the new bus stop is south of the shopping center's unsignalized driveway with Associated Road. An investigation into this location showed an existing streetlight and telephone pole. LSA considered the dimensions of OCTA buses including locations of front and rear doors as detailed in OCTA's *Bus Stop Safety and Design Guidelines*.[1] The exhibit below illustrates the dimensions of the bus stop and the location necessary to avoid relocation of the streetlight or telephone pole. The exhibit shows that approximately 8 feet would remain between the bus stop and the lane line when a bus is stopped. This is sufficient distance for passenger vehicles to continue south on Associated Road and is no different from the existing bus stops along Associated Road. It should be noted that approximately 165 feet would remain between the southern limit of the bus stop and the beginning of the southbound right-turn lane at Associated Road/Imperial Highway. This distance is sufficient to permit lane changes for vehicles to access the proper lane at the intersection. Therefore, LSA does not anticipate any impacts due to design features as a result of the proposed bus stop.

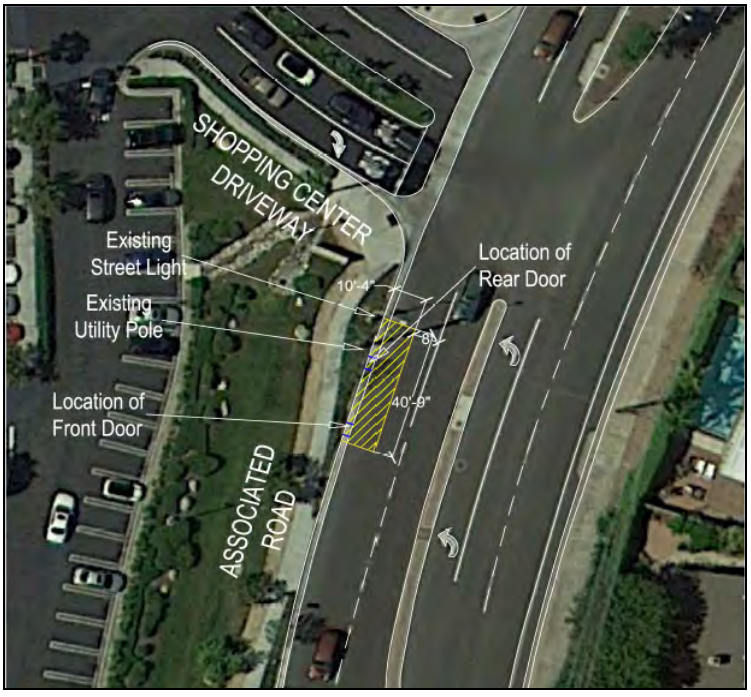

Exhibit 1: The dimensions of the bus stop and the location necessary to avoid relocation of the streetlight or telephone pole

[1] Orange County Transportation Authority. 2004. *Bus Stop Safety and Design Guidelines*.

CONCLUSION

This analysis considered the potential effects to parking demand and supply for the proposed project at the Brea Plaza Shopping Center. The proposed project would replace the existing movie theater and 139 surface parking spaces with 189 residential units, 21,355 sf of office space, and a 397-space parking structure. Of the 189 proposed residential units, 19 would be affordable housing, 15 would be coliving units, and 155 would be traditional market rate apartments.

In the existing condition, the Brea Plaza Shopping Center has a BMC parking requirement for 909 parking spaces, of which 739 spaces are provided on site and the remainder are provided on the adjacent property through a parking easement. However, the BMC parking requirement for the shopping center likely understates the peak parking demand because one use, the movie theater, would require 527 parking spaces if calculated individually.

The BMC parking requirement for the proposed land uses is 46 fewer parking spaces than the 527 parking spaces required for the movie theater. Because the proposed project would also construct 258 more parking spaces than it is replacing, the proposed project would bring greater balance to the parking supply and demand. This parking analysis demonstrated that the project will not rely on the Mercury Insurance parking lot to satisfy typical daily or weekend parking demand.

With the proposed project, the BMC parking requirement would increase to 1,289 parking spaces, of which 997 spaces would be provided on site. However, when considering the proposed project's parking demand management strategies and the effects of shared parking, peak parking demand is anticipated to be 966 on a typical weekday, 979 on a typical weekend, and 1,079 on a December weekend. This peak parking demand could be accommodated within the on-site parking supply and, on a peak December weekend, the flexible parking located within the parking easement.

Parking demand management strategies of the proposed project include providing a lounge for rideshare drivers, subsidizing car sharing for the residents, providing the majority of residential parking in unreserved parking spaces, providing short-term and long-term bicycle parking, and proposing a new bus stop to better serve residents and the shopping center. These parking demand management strategies are included in the SCAG RTP/SCS and have the potential to reduce VMT and GHG emissions in addition to moderating parking demand. LSA appreciates the opportunity to provide its services. If you have any questions, please call me at (949) 553-0666.

Sincerely,
LSA Associates, Inc.

LOCAL REGULATIONS AND STANDARDS

NOISE

Studies have identified noise as an environmental pollutant that can have substantial and permanent impacts on human health and general well-being. Not only is noise a health hazard, excessive noise can be a source of annoyance, tension, and discomfort that disrupts everyday activities. Brea aims to substantially reduce noise and its impacts within the urban environment, with a focus on protecting residential neighborhoods, schools, and similar sensitive uses.

Context

In Brea, street and freeway traffic represent the primary noise sources. Industrial and commercial activity present concerns where adjacent to residential neighborhoods. In addition, mechanical equipment, playgrounds, leaf blowers, and construction equipment are examples of random noise sources that can contribute to neighborhood noise.

Figure PS-5 displays a composite picture of average noise levels in Brea in 2001. As Figure PS-5 illustrates, the loudest noise levels occur along State Highway 57, Imperial Highway, Brea Boulevard, and Valencia Avenue, where truck traffic associated with the Olinda Alpha landfill lumbers past homes and places of business. Lambert Road also experiences loud noise levels due to access to State Highway 57.

Noise and Land Use Compatibility Guidelines

Noise generally is defined as unwanted or intrusive sound. Because noise consists of pitch, loudness, and duration, describing noise with a single unit of measure presents a challenge. The A-weighted decibel scale, or dB(A), has been developed to describe the loudness of a sound or sound environment based on the sensitivity of the human ear. A sound level meter that measures A-weighted decibels has an electrical circuit that allows the meter to have the same sensitivity to sound at different frequencies as the average human ear. Table PS-3 indicates criteria the State has established to reduce adverse noise effects on human health.

Prevent Sleep Interruption	35-45

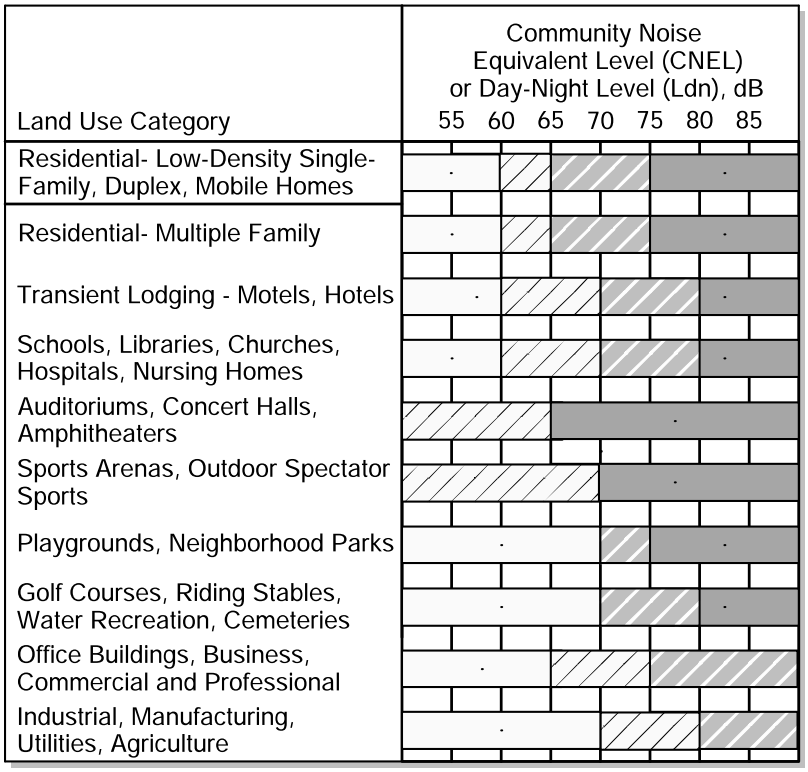
Source: California General Plan Guidelines, 2000.

The dB(A) descriptor only reports noise from a single source or combination of sources at a point in time. To allow a more comprehensive description of a noise environment, federal and State agencies have established noise and land use compatibility guidelines that use averaging approaches to noise measurement. Two measurement scales commonly used in California are the Community Noise Equivalent Level (CNEL) and the day-night level (Ldn). To account for increased human sensitivity at night, the CNEL level includes a 5-decibel penalty on noise during the 7:00 A.M. to 10:00 P.M. time period and a 10-decibel penalty on noise during the 10:00 P.M. to 7:00 A.M. time period. The Ldn level includes only the 10 decibel weighting for late-night noise. These values are nearly identical for all but unusual noise sources.

The City will use land use compatibility standards when planning and making development decisions in order to ensure that noise producers do not adversely affect sensitive receptors.

The City's primary goal with regard to community noise is to minimize the exposure of residents to unhealthful or excessive noise levels to the extent possible. To this end, the noise/land use compatibility guidelines in Figure PS-6, based on cumulative noise criteria for outdoor noise, are used to review development proposals and to identify and mitigation measures necessary to avoid or minimize impacts, including traffic noise impacts, a new use may have on established uses.

Figure PS-6
Noise/Land Use Compatibility



Nature of the noise environment where the CNEL or Ldn level is:

Below 55 dB
Relatively quiet suburban or urban areas, no arterial streets within 1 block, no freeways within 1/4 mile.

55-65 dB
Most somewhat noisy urban areas, near but not directly adjacent to high volumes of traffic.

65-75 dB
Very noisy urban areas near arterials, freeways or airports.

75+ dB
Extremely noisy urban areas adjacent to freeways or under airport traffic patterns. Hearing damage with constant exposure outdoors.

Normally Acceptable
Specified land use is satisfactory, based on the assumption that any buildings are of normal conventional construction, without any special noise insulation requirements

Conditionally Acceptable
New construction or development should be undertaken only after a detailed analysis of noise reduction requirements is made and needed noise insulation features included in design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning, will normally suffice.

Normally Unacceptable
New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of noise reduction requirements must be made and needed noise insulation features included in design.

Clearly Unacceptable
New construction or development should generally not be undertaken.

The Community Noise Equivalent Level (CNEL) and Day-Night Noise Level (Ldn) are measures of the 24-hour noise environment. They represent the constant A-weighted noise level that would be measured if all the sound energy received over the day were averaged. In order to account for the greater sensitivity of people to noise at night, the CNEL weighting includes a 5-decibel penalty on noise between 7:00 p.m. and 10:00 p.m. and a 10-decibel penalty on noise between 10:00 p.m. and 7:00 a.m. of the next day. The Ldn includes only the 10-decibel weighting for late-night noise events. For practical purposes, the two measures are equivalent for typical urban noise environments.

Noise Contours and Noise Impact Areas

The use of noise contours based on the major noise sources can describe the noise environment for the community. Noise contours outline areas of equal noise exposure. Future noise contours have been estimated using information about existing and projected land use development and transportation activity.

The projected noise contours and noise impact areas for Brea are displayed in Figure PS-7. These contours will serve as a guide for land use and development decisions. Contours of 60 dB(A) or greater define noise impact areas. An acoustical analysis must be prepared when noise sensitive land uses are proposed within noise impact areas. The analysis must show that the project is designed to attenuate noise to meet the City's noise standards in order to receive approval. If the project design does not meet the noise standards, mitigation can be recommended in the analysis. If the analysis demonstrates that the noise standards can be met by implementing the mitigation measures, the project can be approved conditioned upon implementation of the mitigation measures.

Transportation Related Noise

Transportation activity is the primary source of noise in Brea. The three major sources of transportation related noise are:

- Traffic on the Orange Freeway (SR-57)
- Commercial truck traffic associated with the Olinda Alpha landfill on Valencia Avenue and Imperial Highway
- Automobile traffic on Brea Boulevard, Brea Canyon Road, Central Avenue, and Lambert Road

Residential neighborhoods bordering the Orange Freeway are subject to loud noise levels. Properties directly adjacent to the freeway can experience decibels as high as 70 to 75 dB(A). Sound attenuation walls, landscaped buffers, and dirt mounds all help to reduce the sound intensity of the freeway. Figure PS-7 illustrates the projected noise contours along the freeway.

Commercial trucks associated with the Olinda Alpha landfill contribute to excessive noise levels via the Orange Freeway, Imperial Highway, and Valencia Avenue to connect with the landfill. Commercial trucks are not permitted to access Valencia Avenue via Lambert Road, minimizing some of the noise impacts to adjacent residential neighborhoods. Olinda Alpha is slated to close in the year 2013; however, the County of Orange is investigating extending the life of the landfill much further.

New residential development has been recently constructed at the northeast corner of Valencia Avenue and Carbon Canyon Road just south of the Olinda Alpha landfill entrance. Dense planting of deciduous and evergreen trees as well as a sound attenuation wall were set within the landscaped area to minimize the impacts to residential properties directly abutting Valencia Avenue.

Proposed residential land uses have also been designated for both sides of Valencia Avenue south of Lambert Road/Carbon Canyon Road. Residential, school, and park uses are proposed for the Hartley Research Center. Careful planning and mitigation within these areas will protect these sensitive uses from excessive noise levels.

Noise levels along Brea Boulevard, Brea Canyon Road, Central Avenue, and Lambert Road are above average and can impact sensitive uses adjacent to these streets.

Traffic noise depends primarily on the speed of traffic and the percentage of truck traffic. The primary source of noise from automobiles is high-frequency tire noise, which increases with speed. In addition, trucks and older automobiles produce engine and exhaust noise.

The most efficient and effective means of controlling noise from transportation systems is to reduce noise at the source. However, the City has little direct control over noise produced by transportation sources because State noise regulations preempt local regulations. Because the City cannot control noise at the source, City noise programs focus on reducing the impact of transportation noise at reception sites. During the planning stages of the development process, potential impacts from transportation noise will be identified and mitigation measures will be required as needed to meet City noise standards.

0 0.5 1 1.5 2 Miles

BREA GENERAL PLAN

Figure PS-6
Future Noise Contours

Sound attenuation walls and limits on speed help to shield residential neighborhoods from automobile noise on Imperial Highway.

Non-Transportation Related Noise

When reviewing a proposed industrial, commercial, or public project, noise generation and potential impacts to surrounding development are considered in accordance with CEQA. Specific attention should be given to non-residential proposals adjacent to residential neighborhoods. An acoustical analysis is required for projects that will generate noise potentially affecting sensitive receptors. Where significant impacts are identified, mitigation measures are required. Common mitigation measures that could be applied when reviewing projects include acoustically treated and quiet design: 1) furnaces, 2) fans, 3) motors, 4) compressors, and 5) valves and pumps. The City may also require limited delivery hours and hours of operation to minimize impacts on adjacent residential users or other sensitive receptors.

Goals and Policies

Certain areas of Brea are subject to high levels of noise. This in turn can reduce the quality of life within these neighborhoods. Consideration of noise sources in the planning process and identification of who that noise impacts is an effective method of minimizing the impacts of noise on residents. Areas already impacted by noise can explore different noise attenuation and rehabilitative improvements.

Goal PS-9	Minimize the impact of point source noise and ambient noise levels throughout the community.
Policy PS-9.1	Evaluate the need to require acoustical studies for development proposals that address both direct and indirect, particularly traffic, noise impacts, and require such studies, with appropriate mitigation included, as warranted.
Policy PS-9.2	Ensure that the noise standards set forth in the Municipal Code reflect standards most appropriate for Brea.
Policy PS-9.3	Ensure that acceptable noise levels are maintained near schools, hospitals, convalescent homes, and other noise sensitive areas in accordance with the City's Municipal Code and noise standards contained in the General Plan.
Policy PS-9.4	Employ creative methods of reducing noise pollution in the City.
Policy PS-9.5	Avoid placing high-noise activity centers near residential areas.

Goal PS-2	Minimize the impacts of transportation-related noise.
Policy PS-2.1	Reduce transportation noise by imposing traffic restrictions where necessary.
Policy PS-2.2	Work with the counties of Orange and Los Angeles to include noise mitigation measures in the design of new roadway projects.

Goal PS-3	Minimize noise impacts from sources other than transportation.
Policy PS-3.1	Require the inclusion of noise mitigation measures, techniques, and design features in the planning, design, and construction of future development and redevelopment projects.

Policy PS-3.2 Require that mixed-use structures be designed to prevent transfer of noise and vibration from commercial/retail to residential use.

Policy PS-3.3 Minimize stationary noise sources and noise emanating from construction activities and special events.

Policy PS-3.4 Require that new non-residential development plan delivery areas away from existing residential areas.

Policy PS-3.5 Continue active enforcement to limit commercial and industrial delivery hours adjoining residential areas.

Implementation Guide

§ 8.20.020 DEFINITIONS.

For the purpose of this chapter, the following definitions shall apply unless the context clearly indicates or requires a different meaning.

AMBIENT NOISE LEVEL. The all-encompassing noise level associated with a given environment, being a composite of sounds from all sources, excluding the alleged offensive noise, at the location and approximate time at which a comparison with the alleged offensive noise is to be made.

CUMULATIVE PERIOD. An additive period of time composed of individual time segments which may be continuous or interrupted.

DECIBEL (dB). A unit which denotes the ratio between two (2) quantities which are proportional to power: the number of decibels corresponding to the ratio or two (2) amounts of power is ten (10) times the logarithm to the base ten (10) of this ratio.

DWELLING UNIT. A single unit providing complete, independent living facilities for one (1) or more persons including permanent provisions for living, sleeping, eating, cooking and sanitation.

EMERGENCY MACHINERY, VEHICLE, OR WORK. Any machinery, vehicle or work used, employed or performed in an effort to protect, provide or restore safe conditions in the community or for the citizenry, or work by private or public utilities when restoring utility service.

FIXED NOISE SOURCE. A stationary device which creates sounds while fixed or motionless, including but not limited to industrial and commercial machinery and equipment, pumps, fans, compressors, generators, air conditioners and refrigeration equipment.

GRADING. Any excavating or filling of earth material, or any combination thereof, conducted at a site to prepare said site for construction or other improvements thereon.

IMPACT NOISE. The noise produced by the collision of one mass in motion with a second mass which may be either in motion or at rest.

MOBILE NOISE SOURCE. Any noise source other than a fixed noise source.

NOISE LEVEL. The “A” weighted sound pressure level in decibels obtained by using a sound level meter at slow response with a reference pressure of twenty (20) micronewtons per square meter. The unit of measurement shall be designated as dB(A).

PERSON. A person, firm, association, co-partnership, joint venture, corporation or any entity, public or private in nature.

RESIDENTIAL PROPERTY. A parcel of real property which is developed and used either in part or in whole for residential purposes, other than transient uses such as hotels and motels.

SIMPLE TONE NOISE. A noise characterized by a predominant frequency or frequencies so that other frequencies cannot be readily distinguished.

SOUND LEVEL METER. An instrument meeting American National Standard Institute's Standard S1.4-1971 for Type 1 or Type 2 sound level meters or an instrument and the associated recording and analyzing equipment which will provide equivalent data.

SOUND PRESSURE LEVEL OF A SOUND, IN DECIBELS. Twenty (20) times the logarithm to the base ten (10) of the ratio of the pressure of the sound to a reference pressure, which reference pressure shall be explicitly stated.

('61 Code, § 7B.2) (Ord. 812, passed - -)

§ 8.20.030 NOISE LEVEL MEASUREMENT CRITERIA.

Any noise level measurements made pursuant to the provisions of this chapter shall be performed using a sound level meter as defined in § 8.20.020.

('61 Code, § 7B.3) (Ord. 812, passed - -)

§ 8.20.040 DESIGNATED NOISE ZONE.

The entire territory of the city is hereby designated as “Noise Zone 1.”

('61 Code, § 7B.4) (Ord. 812, passed - -)

§ 8.20.050 EXTERIOR NOISE STANDARDS.

A. The following noise standards, unless otherwise specifically indicated, shall apply to all residential property within a designated noise zone:

NOISE STANDARDS

Noise Zone	*Noise Level*	*Time Period*
1	55 dB(A)	7:00 a.m. - 10:00 p.m.
1	50 dB(A)	10:00 p.m. - 7:00 a.m.

In the event the alleged offensive noise consists entirely of impact noise, simple tone noise, speech, music, or any combination thereof, each of the above noise levels shall be reduced by five (5) dB(A).

B. It shall be unlawful for any person at any location within the city to create any noise on property owned, leased, occupied, or otherwise controlled by such person, when the foregoing causes the noise level, when measured on any other residential property, to exceed:

1. The noise standard for a cumulative period of more than 30 minutes in any hour; or

2. The noise standard plus five (5) dB(A) for a cumulative period of more than 15 minutes in any hour; or

3. The noise standard plus ten (10) dB(A) for a cumulative period of more than five (5) minutes in any hour; or

4. The noise standards plus fifteen (15) dB(A) for a cumulative period of more than one (1) minute in any hour; or

5. The noise standard plus twenty (20) dB(A) for any period of time.

C. In the event the ambient noise level exceeds any of the first four (4) noise limit categories above, the cumulative period applicable to said category shall be increased to reflect said ambient noise level. In the event the ambient noise level exceeds the fifth noise limit category, the maximum allowable noise level under said category shall be increased to reflect the maximum ambient noise level.

('61 Code, § 7B.5) (Ord. 812, passed - -)

§ 8.20.060 INTERIOR NOISE STANDARDS.

A. The following interior noise standards, unless otherwise specifically indicated, shall apply to all residential property within a designated noise zone:

INTERIOR NOISE STANDARDS

Noise Zone	*Noise Level*	*Time Period*
1	55 dB(A)	7:00 a.m. - 10:00 p.m.
1	45 dB(A)	10:00 p.m. - 7:00 a.m.

In the event the alleged offensive noise consists entirely of impact noise, simple tone noise, speech, music, or any combination thereof, each of the above noise levels shall be reduced by five (5) dB(A).

B. It shall be unlawful for any person at any location within the city to create any noise, or to allow the creation of any noise on property owned, leased, occupied, or otherwise controlled by such person, when the foregoing causes the noise level, when measured on any other residential property, to exceed:

1. The interior noise standard for a cumulative period of more than five (5) minutes in any hour; or

2. The interior noise standard plus five (5) dB(A) for a cumulative period of more than one (1) minute in any hour; or

3. The interior noise standard plus ten (10) dB(A) for any period of time.

C. In the event the ambient noise level exceeds any of the first two (2) noise limit categories above, the cumulative period applicable to said category shall be increased to reflect said ambient noise level. In the event the ambient noise level exceeds the third noise limit category the maximum allowable noise level under said category shall be increased to reflect the maximum ambient noise level.

('61 Code, § 7B.6) (Ord. 812, passed - -)

§ 8.20.070 SPECIAL PROVISIONS.

The following activities shall be exempted from the provisions of this chapter:

A. Activities conducted on the grounds of any public nursery, elementary, intermediate or secondary school or college.

B. Outdoor gatherings, public dances and shows, provided said events are conducted pursuant to a permit as required by this code.

C. Activities conducted on any park or playground, provided such park or playground is owned and operated by a public entity.

D. Any mechanical device, apparatus or equipment used, related to or connected with emergency machinery, vehicle or work.

E. Noise sources associated with construction, repair, remodeling, or grading of any real property, provided said activities do not take place between the hours of 7:00 p.m. and 7:00 a.m. on weekdays, including Saturday, or at any time on Sunday or a federal holiday.

F. All mechanical devices, apparatus or equipment which are utilized for the protection or salvage of agricultural crops during periods of potential or actual frost damage or other adverse weather conditions.

G. Mobile noise sources associated with agricultural operations; provided such operations do not take place between the hours of 7:00 p.m. and 7:00 a.m. on weekdays, including Saturday, or at any time on Sunday or a federal holiday.

H. Mobile noise sources associated with agricultural pest control through pesticide application, provided that the application is made in accordance with restricted material permits issued by or regulations enforced by the Agricultural Commissioner.

I. Noise sources, associated with the maintenance of real property, provided said activities take place between 7:00 a.m. and 7:00 p.m. on any day.

J. Any activity to the extent regulation thereof has been preempted by state or federal law.

('61 Code, § 7B.7) (Ord. 812, passed - -)

§ 8.20.080 MOTOR VEHICLE RACING.

It shall be unlawful to conduct motor vehicle racing, testing, timing or similar noise-producing activities at raceways, speedways, off-road vehicle courses, drag strips or other similar places, including, but not limited to, the operation of midget race cars, drag cars, motorcycles, off-road vehicles, and specialty automobiles, between the hours of 11:30 p.m. and 7:00 a.m.

('61 Code, § 7B.8) (Ord. 812, passed - -)

§ 8.20.090 SCHOOLS, HOSPITALS AND CHURCHES.

It shall be unlawful for any person to create any noise which causes the noise level at any school, hospital or church while same is in use to exceed the noise limits as specified in § 8.20.050 proscribed for the assigned noise zone in which the school, hospital or church is located, or which noise level unreasonably interferes with the use of such institutions or which unreasonably disturbs or annoys patients in the hospital, provided conspicuous signs are displayed in three (3) separate locations within one-tenth of a mile of the institution indicating the presence of a school, church or hospital.

('61 Code, § 7B.9) (Ord. 812, passed - -)

§ 8.20.100 AIR CONDITIONING; REFRIGERATION; POOL FILTERS AND FANS.

During the five (5) year period following the effective date of this chapter, the noise standards enumerated in §§ 8.20.050 and 8.20.060 shall be increased eight (8) dB(A) where the alleged offensive noise source is an air conditioning, or refrigeration system, fan, or swimming pool filter, or associated equipment which was installed prior to the effective date of this chapter.

('61 Code, § 7B.10) (Ord. 812, passed - -)

§ 8.20.110 NOISE LEVEL MEASUREMENT.

The location selected for measuring exterior noise levels shall be at any point on the affected property. Interior noise measurements shall be made within the affected dwelling unit. The measurement shall be made at a point at least four (4) feet from the wall, ceiling or floor nearest the alleged offensive noise source and may be made with the windows of the affected unit open.

('61 Code, § 7B.11) (Ord. 812, passed - -)

§ 8.20.120 MANNER OF ENFORCEMENT.

A. The Police Department, the Code Enforcement Officer and their duly authorized representatives are directed to enforce the provisions of this chapter.

B. No person shall interfere with, oppose or resist any authorized person charged with the enforcement of this chapter while such person is engaged in the performance of his or her duty.

('61 Code, § 7B.12) (Ord. 812, passed - -)

Print

Brea City Code

§ 20.20.040 VIBRATION.

Every use shall be so operated that the ground vibration inherently and recurrently generated does not cause a displacement of the earth greater than .003 of one (1) inch as measured at the property line of the subject use.

(Ord. 425, passed 10-14-68)
